Brugervejledning

Navigation består af en samling pdf-filer af skemaer og tabeller, der kan læses og printes ved hjælp af programmet Acrobat Reader 5.0 eller senere versioner.

Til at navigere rundt er der en Hovedmenu og en række faneblade.
Disse sider skal sammen med Acrobat Readers værktøjslinje anvendes, når der skal navigeres mellem dokumenterne eller til at printe.

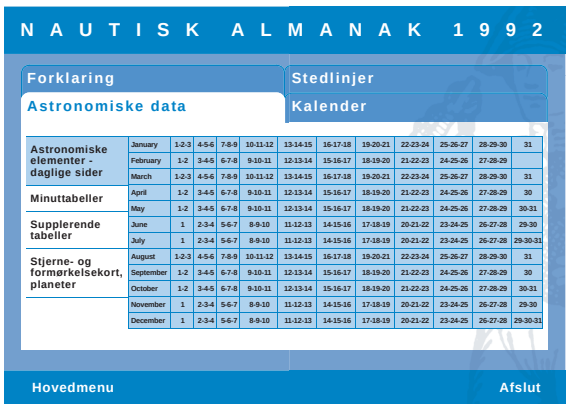
Indhold
For at komme fra indgangsbilledet til fanebladene i de enkelte afsnit, skal der klikkes på det ønskede emne.

Skærmbilleder
Ved opslag i de forskellige menuer vises et skærmbillede af den valgte side i en opløsning, som kan forekomme lidt grov. Når siden udskrives, er opløsningen optimal.

Under de enkelte emner vises en oversigt med et eller flere faneblade.

Ved at klikke på en af fanerne, vises der en ny indholdsfortegnelse.

Til højre for indholdsfortegnelsen vises valgmuligheder for de enkelte dokumenter.



Dokumenterne fra cd'en åbnes ved at klikke på linjerne/cellerne fx 1-2-3 ud for January.
Skal det pågældende dokument printes, er det nødvendigt først at åbne dokumentet, og der skal nu klikkes på  på værktøjslinjen.

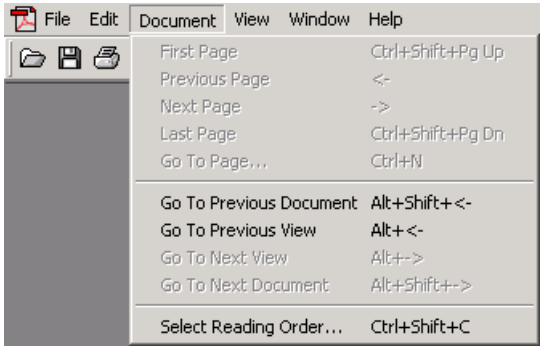
Når dokumentet er åbent, kan der zoomes ind og ud, så det er muligt at se mere detaljerede dele af tegning eller tekst.

For at zoome ind på et specifikt punkt på skemaet eller teksten, skal  bruges. Klik først på  og derefter på selve tegningen eller teksten. Punktet bliver forstørret med 25% pr. klik.

Skal hele skærmbilledet formindskes eller forstørres, kan der klikke på henholdsvis Minus eller Plus 
.
Alternativt kan procenten vælges.
For at returnere til indholdsfortegnelsen, klik på den grå knap 

på første side i dokumentet.

Det er også muligt at bruge menuen: Vælg menuen **Document** og **Go To Previous Document** på menulinjen.



Nogle af dokumenterne består af flere sider. Nederst til venstre vises der, hvor mange sider, der er i dokumentet: 
Brug enten  i værktøjslinjen eller 
nederst for at hoppe fra side til side. hopper én side ad gangen, mens hopper henholdsvis til første eller sidste side.

Print af dokumenter
Skal skemaet/tabellerne printes, klik da på knappen  på værktøjslinjen.

For at returnere til indholdsfortegnelsen kan enten  på værktøjslinjen eller funktionen **Document**, **Go To Previous Document** på menuen benyttes. Hvis  benyttes, skal der eventuelt klikkes flere gange på knappen, da denne funktion kun hopper et “view” tilbage.

The above table is for converting expressions in arc to their equivalent in time; its main use in this Almanac is for the conversion of longitude for application to L.M.T. (*added* if *west*, *subtracted* if *east*) to give UT or vice versa, particularly in the case of sunrise, sunset, etc.

ALTITUDE CORRECTION TABLES 10°-90°—SUN, STARS, PLANETS

Additional corrections for temperature and pressure are given on the following page.

For bubble sextant observations ignore dip and use the star corrections for Sun, planets and stars.

MOON CORRECTION TABLE

The correction is in two parts; the first correction is taken from the upper part of the table with argument apparent altitude, and the second from the lower part, with argument HP, in the same column as that from which the first correction was taken. Separate corrections are given in the lower part for lower (L) and upper(U) limbs. All corrections are to be **added** to apparent altitude, *but 30′ is to be subtracted from the altitude of the upper limb.*

For corrections for pressure and temperature see page A4.

For bubble sextant observations ignore dip, take the mean of upper and lower limb corrections and subtract 15′ from the altitude.

App. Alt. = Apparent altitude = Sextant altitude corrected for index error and dip.

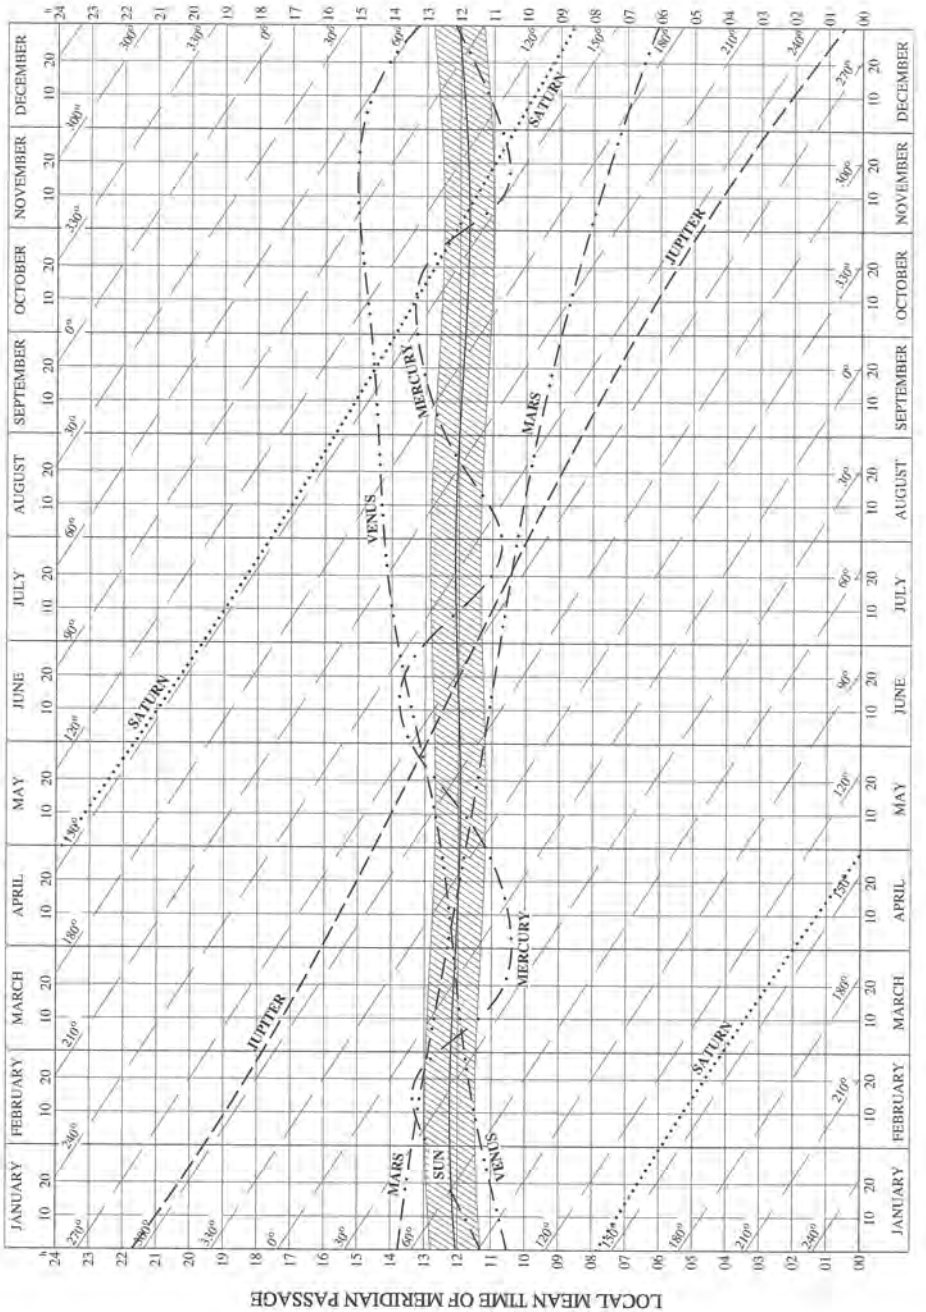
LOCAL MEAN TIME OF MERIDIAN PASSAGE



Tilbage til Menuen

VISIBILITY OF PLANETS

VENUS is a brilliant object in the morning sky from the beginning of the year until mid-February when it becomes too close to the Sun for observation. From the end of the first week of May it reappears in the evening sky where it stays until the end of the year. Venus is in conjunction with Mercury on May 25 and June 20, with Jupiter on May 28 and with Saturn on September 20.

MARS can be seen in the evening sky in Capricornus and in Aquarius from late January until in the second week of February it becomes too close to the Sun for observation. It reappears in the morning sky during the second half of June in Taurus and moves into Gemini from mid-July (passing 6° S of *Pollux* on August 19). It remains in the morning sky for the rest of the year moving into Cancer from late August, Leo in late September (passing 1° N of *Regulus* on October 14) and Virgo from the end of November. Mars is in conjunction with Mercury on February 8 and with Jupiter on July 22.

JUPITER is in Taurus at the beginning of the year, and can be seen for more than half the night until late February after which it can only be seen in the evening sky (passing 5° N of *Aldebaran* on March 24). In the first week of June it becomes too close to the Sun for observation. It reappears in the morning sky in early July in Gemini in which constellation it remains throughout the rest of the year. Jupiter is in conjunction with Mercury on May 27, with Venus on May 28 and with Mars on July 22.

SATURN rises shortly after midnight at the beginning of the year in Libra, passes into Virgo in mid-May and once again into Libra in early September. It is at opposition on April 28 when it can be seen throughout the night, and from late July until mid-October it is visible only in the evening sky. It then becomes too close to the Sun for observation until in the second half of November it reappears, and can be seen in the morning sky for the rest of the year. Saturn is in conjunction with Venus on September 20 and with Mercury on October 10 and November 26.

MERCURY can only be seen low in the east before sunrise, or low in the west after sunset (about the time of beginning or end of civil twilight). It is visible in the mornings between the following approximate dates: January 1 (−0·6) to January 2 (−0·7), March 11 (+2·8) to May 4 (−1·3), July 19 (+2·7) to August 16 (−1·4) and November 8 (+1·5) to December 12 (−0·7) ; the planet is brighter at the end of each period. It is visible in the evenings between the following approximate dates: January 31 (−1·2) to February 26 (+2·0), May 19 (−1·5) to July 1 (+3·2) and September 4 (−0·9) to October 27 (+2·1); the planet is brighter at the beginning of each period. The figures in parentheses are the magnitudes.

PLANET DIAGRAM

General Description. The diagram on the opposite page shows, in graphical form for any date during the year, the local mean time of meridian passage of the Sun, of the five planets Mercury, Venus, Mars, Jupiter, and Saturn, and of each 30° of SHA; intermediate lines corresponding to particular stars, may be drawn in by the user if desired. It is intended to provide a general picture of the availability of planets and stars for observation.

On each side of the line marking the time of meridian passage of the Sun a band, 45^m wide, is shaded to indicate that planets and most stars crossing the meridian within 45^m of the Sun are too close to the Sun for observation.

Method of use and interpretation. For any date the diagram provides immediately the local mean times of meridian passage of the Sun, planets and stars, and thus the following information:

(a) whether a planet or star is too close to the Sun for observation;

(b) some indication of its position in the sky, especially during twilight;

(c) the proximity of other planets.

When the meridian passage of an outer planet occurs at midnight the body is in opposition to the Sun and is visible all night; a planet may then be observable during both morning and evening twilights. As the time of meridian passage decreases, the body eventually ceases to be observable in the morning, but its altitude above the eastern horizon at sunset gradually increases; this continues until the body is on the meridian during evening twilight. From then onwards the body is observable above the western horizon and its altitude at sunset gradually decreases; eventually the body becomes too close to the Sun for observation. When the body again becomes visible it is seen low in the east during morning twilight; its altitude at sunrise increases until meridian passage occurs during morning twilight. Then, as the time of meridian passage decreases to 0^h, the body is observable in the west during morning twilight with a gradually decreasing altitude, until it once again reaches opposition.

DO NOT CONFUSE

Mercury with Mars in early February and with Saturn in early October and late November; on all occasions Mercury is the brighter object.

Venus with Mercury in mid-May to early June and again in mid-June, with Jupiter in late May to early June and with Saturn in mid-September; on all occasions Venus is the brighter object.

Jupiter with Mercury in late May and with Mars in mid-July to early August; on both occasions Jupiter is the brighter object.

Astronomiske data

Forklaring

Forklaring til almanakken	**Forklaring til almanakken**
	Om universal time

EXPLANATION

PRINCIPLE AND ARRANGEMENT

1. *Object.* The object of this Almanac is to provide, in a convenient form, the data required for the practice of astronomical navigation at sea.

2. *Principle.* The main contents of the Almanac consist of data from which the *Greenwich Hour Angle* (GHA) and the *Declination* (Dec) of all the bodies used for navigation can be obtained for any instant of *Universal Time* (UT, specifically UT1, or previously Greenwich Mean Time (GMT)).

The *Local Hour Angle* (LHA) can then be obtained by means of the formula:

$$\text{LHA} = \text{GHA} \begin{matrix} - \text{ west} \\ + \text{ east} \end{matrix} \text{ longitude}$$

The remaining data consist of: times of rising and setting of the Sun and Moon, and times of twilight; miscellaneous calendarial and planning data and auxiliary tables, including a list of Standard Times; corrections to be applied to observed altitude.

For the Sun, Moon, and planets the GHA and Dec are tabulated directly for each hour of UT throughout the year. For the stars the *Sidereal Hour Angle* (SHA) is given, and the GHA is obtained from:

$$\text{GHA Star} = \text{GHA Aries} + \text{SHA Star}$$

The SHA and Dec of the stars change slowly and may be regarded as constant over periods of several days. GHA Aries, or the Greenwich Hour Angle of the first point of Aries (the Vernal Equinox), is tabulated for each hour. Permanent tables give the appropriate increments and corrections to the tabulated hourly values of GHA and Dec for the minutes and seconds of UT.

The six-volume series of *Sight Reduction Tables for Marine Navigation* (published in U.S.A. as Pub. No. 229 and in U.K. as N.P. 401) has been designed for the solution of the navigational triangle and is intended for use with *The Nautical Almanac*.

Two alternative procedures for sight reduction are described on pages 277–318. The first requires the use of programmable calculators or computers, while the second uses a set of concise tables that is given on pages 286–317.

The tabular accuracy is 0′.1 throughout. The time argument on the daily pages of this Almanac is UT1 denoted throughout by UT. This scale may differ from the broadcast time signals (UTC) by an amount which, if ignored, will introduce an error of up to 0′.2 in longitude determined from astronomical observations. The difference arises because the time argument depends on the variable rate of rotation of the Earth while the broadcast time signals are based on an atomic time-scale. Step adjustments of exactly one second are made to the time signals as required (normally at 24^h on December 31 and June 30) so that the difference between the time signals and UT, as used in this Almanac, may not exceed $0^s.9$. Those who require to reduce observations to a precision of better than 1^s must therefore obtain the correction (DUT1) to the time signals from coding in the signal, or from other sources; the required time is given by UT1=UTC+DUT1 to a precision of $0^s.1$. Alternatively, the longitude, when determined from astronomical observations, may be corrected by the corresponding amount shown in the following table:

Correction to time signals	Correction to longitude
$-0^s.9$ to $-0^s.7$	0′.2 to east
$-0^s.6$ to $-0^s.3$	0′.1 to east
$-0^s.2$ to $+0^s.2$	no correction
$+0^s.3$ to $+0^s.6$	0′.1 to west
$+0^s.7$ to $+0^s.9$	0′.2 to west

3. *Lay-out.* The ephemeral data for three days are presented on an opening of two pages: the left-hand page contains the data for the planets and stars; the right-hand page contains the data for the Sun and Moon, together with times of twilight, sunrise, sunset, moonrise and moonset.

The remaining contents are arranged as follows: for ease of reference the altitude-correction tables are given on pages A2, A3, A4, xxxiv and xxxv; calendar, Moon's phases, eclipses, and planet notes (i.e. data of general interest) precede the main tabulations. The Explanation is followed by information on standard times, star charts and list of star positions, sight reduction procedures and concise sight reduction tables, tables of increments and corrections and other auxiliary tables that are frequently used.

MAIN DATA

4. *Daily pages.* The daily pages give the GHA of Aries, the GHA and Dec of the Sun, Moon, and the four navigational planets, for each hour of UT. For the Moon, values of v and d are also tabulated for each hour to facilitate the correction of GHA and Dec to intermediate times; v and d for the Sun and planets change so slowly that they are given, at the foot of the appropriate columns, once only on the page; v is zero for Aries and negligible for the Sun, and is omitted. The SHA and Dec of the 57 selected stars, arranged in alphabetical order of proper name, are also given.

5. *Stars.* The SHA and Dec of 173 stars, including the 57 selected stars, are tabulated for each month on pages 268–273; no interpolation is required and the data can be used in precisely the same way as those for the selected stars on the daily pages. The stars are arranged in order of SHA.

The list of 173 includes all stars down to magnitude 3·0, together with a few fainter ones to fill the larger gaps. The 57 selected stars have been chosen from amongst these on account of brightness and distribution in the sky; they will suffice for the majority of observations.

The 57 selected stars are known by their proper names, but they are also numbered in descending order of SHA. In the list of 173 stars, the constellation names are always given on the left-hand page; on the facing page proper names are given where well-known names exist. Numbers for the selected stars are given in both columns.

An index to the selected stars, containing lists in both alphabetical and numerical order, is given on page xxxiii and is also reprinted on the bookmark.

6. *Increments and corrections.* The tables printed on tinted paper (pages ii–xxxi) at the back of the Almanac provide the increments and corrections for minutes and seconds to be applied to the hourly values of GHA and Dec. They consist of sixty tables, one for each minute, separated into two parts: increments to GHA for Sun and planets, Aries, and Moon for every minute and second; and, for each minute, corrections to be applied to GHA and Dec corresponding to the values of v and d given on the daily pages.

The increments are based on the following adopted hourly rates of increase of the GHA: Sun and planets, 15° precisely; Aries, 15° 02′.46; Moon, 14° 19′.0. The values of v on the daily pages are the excesses of the actual hourly motions over the adopted values; they are generally positive, except for Venus. The tabulated hourly values of the Sun's GHA have been adjusted to reduce to a minimum the error caused by treating v as negligible. The values of d on the daily pages are the hourly differences of the Dec. For the Moon, the true values of v and d are given for each hour; otherwise mean values are given for the three days on the page.

7. *Method of entry.* The UT of an observation is expressed as a day and hour, followed by a number of minutes and seconds. The tabular values of GHA and Dec, and, where necessary, the corresponding values of v and d, are taken directly from the daily pages for the day and hour of UT; this hour is always *before* the time of observation. SHA and Dec of the selected stars are also taken from the daily pages.

The table of Increments and Corrections for the minute of UT is then selected. For the GHA, the increment for minutes and seconds is taken from the appropriate column opposite the seconds of UT; the v-correction is taken from the second part of the same table opposite the value of v as given on the daily pages. Both increment and v-correction are to be added to the GHA, except for Venus when v is prefixed by a minus sign and the v-correction is to be subtracted. For the Dec there is no increment, but a d-correction is applied in the same way as the v-correction; d is given without sign on the daily pages and the sign of the correction is to be supplied by inspection of the Dec column. In many cases the correction may be applied mentally.

8. *Examples.* (a) Sun and Moon. Required the GHA and Dec of the Sun and Moon on 2013 November 13 at $15^h\ 47^m\ 13^s$ UT.

		SUN			MOON			
		GHA	Dec	d	GHA	v	Dec	d
		° ′	° ′	′	° ′	′	° ′	′
Daily page, November $13^d\ 15^h$		48 55·0	S 18 06·5	0·7	275 19·7	12·0	N 4 18·4	10·8
Increments for	$47^m\ 13^s$	11 48·3			11 16·0			
v or d corrections for	47^m		+0·6		+9·5		+8·6	
Sum for November $13^d\ 15^h\ 47^m\ 13^s$		60 43·3	S 18 07·1		286 45·2		N 4 27·0	

(b) Planets. Required the LHA and Dec of (i) Venus on 2013 November 13 at $13^h\ 58^m\ 16^s$ UT in longitude E 70° 19′; (ii) Mars on 2013 November 13 at $8^h\ 44^m\ 06^s$ UT in longitude W 53° 11′.

		VENUS				MARS

		°	′	° ′		°	′	° ′
Daily page (SHA and Dec)		258	33·2	S 16 44.1		80	39·1	N 38 48.2
Daily page (GHA Aries)	(8^h)	172	36·2		(21^h)	8	08·2	
Increments (Aries)	$(44^m\ 06^s)$	11	03·3		$(45^m\ 38^s)$	11	26·4	
Sum = GHA star		442	12·7			100	13·7	
Multiples of 360°		−360						
GHA star		82	12·7			100	13·7	

9. *Polaris (Pole Star) tables.* The tables on pages 274–276 provide means by which the latitude can be deduced from an observed altitude of *Polaris*, and they also give its azimuth; their use is explained and illustrated on those pages. They are based on the following formula:

$$\text{Latitude} - H_O = -p\cos h + \tfrac{1}{2}p\sin p\sin^2 h\tan(\text{latitude})$$

where H_O = Apparent altitude (corrected for refraction)

p = polar distance of *Polaris* = 90° − Dec

h = local hour angle of *Polaris* = LHA Aries + SHA

a_0, which is a function of LHA Aries only, is the value of both terms of the above formula calculated for mean values of the SHA (317° 43′) and Dec (N 89° 19′3) of *Polaris*, for a mean latitude of 50°, and adjusted by the addition of a constant (58′8).

a_1, which is a function of LHA Aries and latitude, is the excess of the value of the second term over its mean value for latitude 50°, increased by a constant (0′.6) to make it always positive. a_2, which is a function of LHA Aries and date, is the correction to the first term for the variation of *Polaris* from its adopted mean position; it is increased by a constant (0′.6) to make it positive. The sum of the added constants is 1°, so that:

$$\text{Latitude} = \text{Apparent altitude (corrected for refraction)} - 1^\circ + a_0 + a_1 + a_2$$

RISING AND SETTING PHENOMENA

10. *General.* On the right-hand daily pages are given the times of sunrise and sunset, of the beginning and end of civil and nautical twilights, and of moonrise and moonset for a range of latitudes from N 72° to S 60°. These times, which are given to the nearest minute, are strictly the UT of the phenomena on the Greenwich meridian; they are given for every day for moonrise and moonset, but only for the middle day of the three on each page for the solar phenomena.

They are approximately the Local Mean Times (LMT) of the corresponding phenomena on other meridians; they can be formally interpolated if desired. The UT of a phenomenon is obtained from the LMT by:

$$\text{UT} = \text{LMT} \begin{matrix} + \text{ west} \\ - \text{ east} \end{matrix} \text{ longitude}$$

in which the longitude must first be converted to time by the table on page i or otherwise.

Interpolation for latitude can be done mentally or with the aid of Table I on page xxxii.

The following symbols are used to indicate the conditions under which, in high latitudes, some of the phenomena do not occur:

☐ Sun or Moon remains continuously above the horizon;

■ Sun or Moon remains continuously below the horizon;

//// twilight lasts all night.

Basis of the tabulations. At sunrise and sunset 16′ is allowed for semi-diameter and 34′ for horizontal refraction, so that at the times given the Sun's upper limb is on the visible horizon; all times refer to phenomena as seen from sea level with a clear horizon.

At the times given for the beginning and end of twilight, the Sun's zenith distance is 96° for civil, and 102° for nautical twilight. The degree of illumination at the times given for civil twilight (in good conditions and in the absence of other illumination) is such that the brightest stars are visible and the horizon is clearly defined. At the times given for nautical twilight the horizon is in general not visible, and it is too dark for observation with a marine sextant.

Times corresponding to other depressions of the Sun may be obtained by interpolation or, for depressions of more than 12°, less reliably, by extrapolation; times so obtained will be subject to considerable uncertainty near extreme conditions.

At moonrise and moonset allowance is made for semi-diameter, parallax, and refraction (34′), so that at the times given the Moon's upper limb is on the visible horizon as seen from sea level.

11. *Sunrise, sunset, twilight.* The tabulated times may be regarded, without serious error, as the LMT of the phenomena on any of the three days on the page and in any longitude. Precise times may normally be obtained by interpolating the tabular values for latitude and to the correct day and longitude, the latter being expressed as a fraction of a day by dividing it by 360°, positive for west and negative for east longitudes. In the extreme conditions near ☐, ■ or //// interpolation may not be possible in one direction, but accurate times are of little value in these circumstances.

Examples. Required the UT of (a) the beginning of morning twilights and sunrise on 2013 January 13 for latitude S 48° 55′, longitude E 75° 18′; (b) sunset and the end of evening twilights on 2013 January 15 for latitude N 67° 10′, longitude W 168° 05′.

	(a)	Twilight Nautical	Twilight Civil	Sunrise	(b)	Sunset	Twilight Civil	Twilight Nautical
		d h m	d h m	d h m		d h m	d h m	d h m
From p. 19								
LMT for Lat	S 45°	13 03 10	13 03 56	13 04 32	N 66°	15 14 24	15 15 43	15 16 54
Corr. to (p. xxxii, Table I)	S 48° 55′	−30	−20	−16	N 67° 10′	−22	−12	−6
Long (p. i)	E 75° 18′	−5 01	−5 01	−5 01	W 168° 05′	+11 12	+11 12	+11 12
UT		12 21 39	12 22 35	12 23 15		16 01 14	16 02 43	16 04 00

The LMT are strictly for January 14 (middle date on page) and 0° longitude; for more precise times it is necessary to interpolate, but rounding errors may accumulate to about 2^m.

(a) to January $13^d - 75°/360° = \text{Jan. } 12^d8$, i.e. $\frac{1}{3}(1{\cdot}2) = 0{\cdot}4$ backwards towards the data for the same latitude interpolated similarly from page 17; the corrections are -2^m to nautical twilight, -2^m to civil twilight and -2^m to sunrise.

(b) to January $15^d + 168°/360° = \text{Jan. } 15^d5$, i.e. $\frac{1}{3}(1{\cdot}5) = 0{\cdot}5$ forwards towards the data for the same latitude interpolated similarly from page 21; the corrections are $+7^m$ to sunset, $+4^m$ to civil twilight, and $+4^m$ to nautical twilight.

12. *Moonrise, moonset.* Precise times of moonrise and moonset are rarely needed; a glance at the tables will generally give sufficient indication of whether the Moon is available for observation and of the hours of rising and setting. If needed, precise times may be obtained as follows. Interpolate for latitude, using Table I on page xxxii, on the day wanted and also on the preceding day in east longitudes or the following day in west longitudes; take the difference between these times and interpolate for longitude by applying to the time for the day wanted the correction from Table II on page xxxii, so that the resulting time is between the two times used. In extreme conditions near ☐ or ■ interpolation for latitude or longitude may be possible only in one direction; accurate times are of little value in these circumstances.

To facilitate this interpolation the times of moonrise and moonset are given for four days on each page; where no phenomenon occurs during a particular day (as happens once a month) the time of the phenomenon on the following day, increased by 24^h, is given; extra care must be taken when interpolating between two values, when one of those values exceeds 24^h. In practice it suffices to use the daily difference between the times for the nearest tabular latitude, and generally, to enter Table II with the nearest tabular arguments as in the examples below.

Examples. Required the UT of moonrise and moonset in latitude S 47° 10′, longitudes E 124° 00′ and W 78° 31′ on 2013 January 17.

	Longitude E 124° 00′ Moonrise	Moonset	Longitude W 78° 31′ Moonrise	Moonset
	d h m	d h m	d h m	d h m
LMT for Lat. S 45°	17 11 14	17 22 26	17 11 14	17 22 26

UT	17 02 37	17 13 58	17 16 46	18 03 45

ALTITUDE CORRECTION TABLES

13. *General.* In general two corrections are given for application to altitudes observed with a marine sextant; additional corrections are required for Venus and Mars and also for very low altitudes.
