Tables of the correction for dip of the horizon, due to height of eye above sea level, are given on pages A2 and xxxiv. Strictly this correction should be applied first and subtracted from the sextant altitude to give apparent altitude, which is the correct argument for the other tables.

Separate tables are given of the second correction for the Sun, for stars and planets (on pages A2 and A3), and for the Moon (on pages xxxiv and xxxv). For the Sun, values are given for both lower and upper limbs, for two periods of the year. The star tables are used for the planets, but additional corrections for parallax (page A2) are required for Venus and Mars. The Moon tables are in two parts: the main correction is a function of apparent altitude only and is tabulated for the lower limb (30′ must be subtracted to obtain the correction for the upper limb); the other, which is given for both lower and upper limbs, depends also on the horizontal parallax, which has to be taken from the daily pages.

An additional correction, given on page A4, is required for the change in the refraction, due to variations of pressure and temperature from the adopted standard conditions; it may generally be ignored for altitudes greater than 10°, except possibly in extreme conditions. The correction tables for the Sun, stars, and planets are in two parts; only those for altitudes greater than 10° are reprinted on the bookmark.

14. *Critical tables.* Some of the altitude correction tables are arranged as critical tables. In these an interval of apparent altitude (or height of eye) corresponds to a single value of the correction; no interpolation is required. At a "critical" entry the upper of the two possible values of the correction is to be taken. For example, in the table of dip, a correction of −4′.1 corresponds to all values of the height of eye from 5·3 to 5·5 metres (17·5 to 18·3 feet) inclusive.

15. *Examples.* The following examples illustrate the use of the altitude correction tables; the sextant altitudes given are assumed to be taken on 2013 August 12 with a marine sextant at height 5·4 metres (18 feet), temperature −3°C and pressure 982 mb, the Moon sights being taken at about 10^h UT.

	SUN lower limb	SUN upper limb	MOON lower limb	MOON upper limb	VENUS	*Polaris*
	° ′	° ′	° ′	° ′	° ′	° ′
Sextant altitude	21 19·7	3 20·2	33 27·6	26 06·7	4 32·6	49 36·5
Dip, height 5·4 metres (18 feet)	−4·1	−4·1	−4·1	−4·1	−4·1	−4·1
Main correction	+13·6	−29·3	+57·4	+60·5	−10·8	−0·8
−30′ for upper limb (Moon)	—	—	—	−30·0	—	—
L, U correction for Moon	—	—	+4·6	+3·4	—	—
Additional correction for Venus	—	—	—	—	+0·1	—
Additional refraction correction	−0·1	−0·6	−0·1	−0·1	−0·5	0·0
Corrected sextant altitude	21 29·1	2 46·2	34 25·4	26 36·4	4 17·3	49 31·6

The main corrections have been taken out with apparent altitude (sextant altitude corrected for index error and dip) as argument, interpolating where possible. These refinements are rarely necessary.

16. *Composition of the Corrections.* The table for the dip of the sea horizon is based on the formula:

$$\text{Correction for dip} = -1'.76\sqrt{(\text{height of eye in metres})} = -0'.97\sqrt{(\text{height of eye in feet})}$$

The correction table for the Sun includes the effects of semi-diameter, parallax and mean refraction.

The correction tables for the stars and planets allow for the effect of mean refraction.

The phase correction for Venus has been incorporated in the tabulations for GHA and Dec, and no correction for phase is required. The additional corrections for Venus and Mars allow for parallax. Alternatively, the correction for parallax may be calculated from $p \cos H$, where p is the parallax and H is the altitude. In 2013 the values for p are:

Venus	Jan. 1	0′.1	Sept. 21	0′.2	Nov. 11	0′.3	Dec. 5	0′.4	Dec. 20	0′.5	Dec. 31
Mars	Jan. 1	0′.1	Dec. 31								

The correction table for the Moon includes the effect of semi-diameter, parallax, augmentation and mean refraction.

Mean refraction is calculated for a temperature of 10°C (50°F), a pressure of 1010 mb (29·83 inches), humidity of 80% and wavelength 0·50169 μm.

17. *Bubble sextant observations.* When observing with a bubble sextant no correction is necessary for dip, semi-diameter, or augmentation. The altitude corrections for the stars and planets on page A2 and on the bookmark should be used for the Sun as well as for the stars and planets; for the Moon it is easiest to take the mean of the corrections for lower and upper limbs and subtract 15′ from the altitude; the correction for dip must not be applied.

AUXILIARY AND PLANNING DATA

18. *Sun and Moon.* On the daily pages are given: hourly values of the horizontal parallax of the Moon; the semi-diameters and the times of meridian passage of both Sun and Moon over the Greenwich meridian; the equation of time; the age of the Moon, the percent (%) illuminated and a symbol indicating the phase. The times of the phases of the Moon are given in UT on page 4. For the Moon, the semi-diameters for each of the three days are given at the foot of the column; for the Sun a single value is sufficient. Table II on page xxxii may be used for interpolating the time of the Moon's meridian passage for longitude. The equation of time is given daily at 00^h and 12^h UT. The sign is *positive* for unshaded values and *negative* for shaded values. To obtain apparent time add the equation of time to mean time when the sign is *positive*. Subtract the equation of time from mean time when the sign is *negative*. At 12^h UT, when the sign is *positive*, meridian passage of the Sun occurs *before* 12^h UT, otherwise it occurs *after* 12^h UT.

19. *Planets.* The magnitudes of the planets are given immediately following their names in the headings on the daily pages; also given, for the middle day of the three on the page, are their SHA at 00^h UT and their times of meridian passage.

The planet notes and diagram on pages 8 and 9 provide descriptive information as to the suitability of the planets for observation during the year, and of their positions and movements.

20. *Stars.* The time of meridian passage of the first point of Aries over the Greenwich meridian is given on the daily pages, for the middle day of the three on the page, to 0^m1. The interval between successive meridian passages is $23^h\ 56^m1$ (24^h less 3^m9) so that times for intermediate days and other meridians can readily be derived. If a precise time is required it may be obtained by finding the UT at which LHA Aries is zero.

The meridian passage of a star occurs when its LHA is zero, that is when LHA Aries + SHA = 360°. An approximate time can be obtained from the planet diagram on page 9.

The star charts on pages 266 and 267 are intended to assist identification. They show the relative positions of the stars in the sky as seen from the Earth and include all 173 stars used in the Almanac, together with a few others to complete the main constellation configurations. The local meridian at any time may be located on the chart by means of its SHA which is 360° − LHA Aries, or west longitude − GHA Aries.

21. *Star globe.* To set a star globe on which is printed a scale of LHA Aries, first set the globe for latitude and then rotate about the polar axis until the scale under the edge of the meridian circle reads LHA Aries.

To mark the positions of the Sun, Moon, and planets on the star globe, take the difference GHA Aries − GHA body and use this along the LHA Aries scale, in conjunction with the declination, to plot the position. GHA Aries − GHA body is most conveniently found by taking the difference when the GHA of the body is small (less than 15°), which happens once a day.

22. *Calendar.* On page 4 are given lists of ecclesiastical festivals, and of the principal anniversaries and holidays in the United Kingdom and the United States of America. The calendar on page 5 includes the day of the year as well as the day of the week.

Brief particulars are given, at the foot of page 5, of the solar and lunar eclipses occurring during the year; the times given are in UT. The principal features of the more important solar eclipses are shown on the maps on pages 6 and 7.

23. *Standard times.* The lists on pages 262–265 give the standard times used in most countries. In general no attempt is made to give details of the beginning and end of summer time, since they are liable to frequent changes at short notice. For the latest information consult Admiralty List of Radio Signals Volume 2 (NP 282) corrected by Section VI of the weekly edition of Admiralty Notices to Mariners.

The Date or Calendar Line is an arbitrary line, on either side of which the date differs by one day; when crossing this line on a westerly course, the date must be advanced one day; when crossing it on an easterly course, the date must be put back one day. The line is a modification of the line of the 180th meridian, and is drawn so as to include, as far as possible, islands of any one group, etc., on the same side of the line. It may be traced by starting at the South Pole and joining up to the following positions:

Lat	S	51·0	S	45·0	S	15·0	S	5·0	N	48·0	N	53·0	N	65·5
Long		180·0	W	172·5	W	172·5		180·0		180·0	E	170·0	W	169·0

thence through the middle of the Diomede Islands to Lat N 68°·0, Long W 169°·0, passing east of Ostrov Vrangelya (Wrangel Island) to Lat N 75°·0, Long 180°·0, and thence to the North Pole.

ACCURACY

24. *Main data.* The quantities tabulated in this Almanac are generally correct to the nearest 0′·1; the exception is the Sun's GHA which is deliberately adjusted by up to 0′·15 to reduce the error due to ignoring the v-correction. The GHA and Dec at intermediate times cannot be obtained to this precision, since at least two quantities must be added; moreover, the v- and d-corrections are based on mean values of v and d and are taken from tables for the whole minute only. The largest error that can occur in the GHA or Dec of any body other than the Sun or Moon is less than 0′·2; it may reach 0′·25 for the GHA of the Sun and 0′·3 for that of the Moon.

In practice it may be expected that only one third of the values of GHA and Dec taken out will have errors larger than 0′·05 and less than one tenth will have errors larger than 0′·1.

25. *Altitude corrections.* The errors in the altitude corrections are nominally of the same order as those in GHA and Dec, as they result from the addition of several quantities each correctly rounded off to 0′·1. But the actual values of the dip and of the refraction at low altitudes may, in extreme atmospheric conditions, differ considerably from the mean values used in the tables.

USE OF THIS ALMANAC IN 2014

This Almanac may be used for the Sun and stars in 2014 in the following manner.

For the Sun, take out the GHA and Dec for the same date but for a time $5^h\ 48^m\ 00^s$ *earlier* than the UT of observation; add 87° 00′ to the GHA so obtained. The error, mainly due to planetary perturbations of the Earth, is unlikely to exceed 0′·4.

For the stars, calculate the GHA and Dec for the same date and the same time, but *subtract* 15′·1 from the GHA so found. The error, due to incomplete correction for precession and nutation, is unlikely to exceed 0′·4. If preferred, the same result can be obtained by using a time $5^h\ 48^m\ 00^s$ earlier than the UT of observation (as for the Sun) and adding 86° 59′·2 to the GHA (or adding 87° as for the Sun and subtracting 0′·8, for precession, from the SHA of the star).

The Almanac cannot be so used for the Moon or planets.

OM UNIVERSAL TIME

Tidsargumentet i nautiske almanakker har gennem århundreder været Greenwich Mean Time (GMT). GMT baserer sig på en tænkt sols (middelsols) jævne bevægelse omkring jorden i et middelsolår og angiver i ethvert øjeblik middelsolens timevinkel vest for Greenwich meridianen + 12 timer.

På grund af ganske små variationer i jordens rotationsakses stilling i verdensrummet er ikke alle middelsoldøgn præcis lige lange. Selvom der er tale om forskelle på brøkdele af sekunder, så har udviklingen bl.a. inden for de tekniske navigationssystemer medført et behov for en nøjagtigere og mere konstant tidsmåling.

I dag defineres et tidssekund som et antal perioder i cæsium-133 atomets stråling ved overgangen fra en bestemt energitilstand til en anden. Tidsangivelse på grundlag heraf kaldes Universal Time Coordinated (UTC). I praksis benyttes dog Universal Time Uncorrected (UT0, i nærværende almanak betegnet UT).

UT kan i praktisk navigation sættes lig GMT. Den største fejl der derved vil kunne indføres i et klokkeslæt bliver 0,9 sekund, hvilket svarer til 0,2' i en længde beregnet ved en astronomisk observation. Når forskellen mellem UT (GMT) og UTC bliver nøjagtigt 1 sekund rettes de over radioen udsendte tidssignaler. Dette sker efter behov normalt kl. 2400 den 30. juni og den 31. december.

TIDE TABLES 2013

INSTRUCTIONS FOR THE USE OF TABLES

TO FIND THE TIMES AND HEIGHTS OF HIGH AND LOW WATER

Standard Ports

The times and heights of high and low water are tabulated for every day of the year. The zone time used for the predicted times is usually the standard time for the area and is given at the top of each page. Care should be taken to ensure that this is the actual time zone in use on that date, the predicted time being corrected if necessary. Special care is needed for those ports whose time is changed during the year. In the British Isles, Greenwich Mean Time is shown throughout the year and a correction must be applied during the period of "Summer Time".

The heights are shown in metres referred to the chart datum of the port concerned.

Secondary Ports

The times of high and low water are obtained by applying the time differences tabulated in Part II to the daily prediction for the most suitable (not necessarily the closest) Standard Port. The Standard Port to be used is that which appears in **bold type** at the head of the subsection in Part II. Other Standard Ports may occur within a subsection in their correct geographical sequence but full data for these are not shown. The times obtained by applying these corrections are in the zone time shown next above the Secondary Port irrespective of the zone time used for the Standard Port predictions. Special care is needed when considering adjacent ports in different countries which may not be keeping the same time.

The time differences given are approximately the maximum and minimum differences which will be found to occur under normal weather conditions. Although these differences are normally shown to the nearest minute it must not be assumed that the resulting predictions will be to this accuracy.

Predictions which fall between the times given for the Standard Port at the head of each column can be obtained by simple interpolation between the columns. Time differences must not be extrapolated but only interpolated between the given values for times at Standard Ports which give values throughout a 24 hour period. Thus for secondary ports referred to SHOREHAM:

				HW		LW	
				0500 and 1700	1000 and 2200	0000 and 1200	0600 and 1800
81	**SHOREHAM**	(see page 42)					
75	Worthing	50 48	0 22	+0010	0000	-0005	-0010

the HW time difference for a tide which occurs at SHOREHAM at 1230 must be interpolated between the values tabulated for 1000 and 1700. High waters which occur at SHOREHAM at both 2330 and at 0300 must have their time differences interpolated between those values tabulated for 2200 and 0500. If a number of tides are required stretching over a period a graphical solution is a convenient method of obtaining this interpolation.

The heights of high and low water are obtained by applying the height differences tabulated in Part II to the daily predictions for the same Standard Port as is used for the times. These differences are tabulated for mean spring and mean neap levels at the Standard Port. Unless there is a statement to the contrary in Part II it may be assumed that the variation is linear and differences for heights other than springs and neaps may be obtained by interpolation or extrapolation. It MUST be noted that the predictions for the Standard Ports include the seasonal changes for the Standard Port which may be different from those for the Secondary Port. The seasonal changes tabulated in Part II (and Part III) are shown for the first day of each month (i.e. Jan 1 is the first of January, and so on). They should be suitably interpolated for the day of the prediction. The first step is therefore to SUBTRACT algebraically the seasonal change for the Standard Port from the predicted height obtained from Part I . The next step is to apply the height difference corresponding to this corrected height at the Standard Port, interpolating or extrapolating as necessary. The final step is to ADD algebraically the seasonal change for the Secondary Port. In both cases great care must be taken to ensure that the signs of the seasonal changes are correctly applied. Where no seasonal changes are given they are less than 0·1 m and can be ignored. Allowance has been made in the preparation of the tables for any difference in the level of chart datum between the Standard and Secondary Port and the resulting heights are referred to *chart datum at the Secondary Port concerned.* See Example I.

Programmable Calculators can be used with advantage for the arithmetic of the Simplified Harmonic Method of Tidal Prediction. A recommended method with a form and worked example for use when programming can be found on page xxxi.

The accuracy of a prediction for a Secondary Port will depend on the amount of work involved. The less work undertaken, the less accurate the prediction is likely to be. All the data necessary for a more accurate prediction are published in this volume where such data exists.

TO FIND THE HEIGHT OF TIDE AT TIMES BETWEEN HIGH AND LOW WATER

Standard Ports

Intermediate times and heights may best be predicted by the use of the Mean Spring and Neap Curves which are given before the daily predictions for each port. See Examples II and III.

Secondary Ports

For Secondary Ports on a stretch of coast where there is little change of shape between adjacent Standard Port curves and where the duration of rise or fall at the Secondary Port is not markedly different from that of the appropriate Standard Port (i.e. where HW and LW time differences in Part II are nearly the same) intermediate times and heights may be obtained by using the Mean Spring and Neap Curves for the appropriate Standard Port. See Examples IV and V.

Between Swanage and Selsey the tide is of considerable complexity and justifies the inclusion of individual curves - shown on pages xxvii to xxix.

In some other cases the use of the Simplified Harmonic Method of Tidal Prediction is recommended where the intermediate heights are important; these ports are indicated in Part II by "c". This method may sometimes be improved by adjusting the curve to fit high and low waters derived from the time and height differences, particularly when a large range of tide is involved.

See page xxxi for instructions on the use of calculators and the Simplified Harmonic Method of Tidal Prediction. The harmonic constants required for this method will be found in Part III of these tables, the Tidal Angles and Factors in Table VII, and Forms A and B at the back of the book. The remainder of this section is therefore devoted to the descriptions of and instructions for the use of the Mean Spring and Neap Curves in Admiralty Tide Tables.

CURVE INTERPOLATION

Mean Spring and Neap Curves for Standard Ports show the factor of the range attained at given time intervals relative to that of HW: thus by definition HW=1 and LW=0

The spring curve is shown in solid line and the neap curve, where it differs from the spring in pecked. Interpolation can be made by eye using the plotted positions of the predicted heights with reference to the levels of MHWS etc. *No attempt should be made to extrapolate beyond the spring or neap curves:* for ranges greater than springs the spring curve should be used, while for ranges less than neaps the neap curve should be used.

Where there is an appreciable change in duration between spring and neap tides the results obtained may have a slight error. This error will normally be greatest near LW but in the few cases where the times are plotted relative to LW it will be greatest near HW.

MEAN LEVELS

The values of MLWS, MLWN, MSL, MHWN and MHWS are shown for Standard Ports in Table V and Part II. The equivalent values for Secondary Ports may be found by the direct application of the appropriate height differences tabulated in Part II.

HIGHEST AND LOWEST LEVELS

The values of HAT and LAT for Standard Ports are shown in Table V, Part 1. The values of HAT for Secondary Ports are shown in Table V, Part 2. The values of LAT at Secondary Ports may be *inferred* by linear extrapolation beyond the given height differences tabulated in Part II for a tide that reaches the appropriate level at the Standard Port using the graphical solution for the examples on the following pages.

OFFSHORE AREAS AND PLACES BETWEEN SECONDARY PORTS

Tidal predictions for offshore areas and stretches of coastline between Secondary Ports should be obtained by the use of Co-Tidal Charts. For details of Co-Tidal Charts available see page 368 and the Catalogue of Admiralty Charts. Full instructions for their use are contained on the body of the charts.

DETAILED INSTRUCTIONS AND EXAMPLES

The Tidal Prediction Form is intended to assist with time and height calculations. The examples have been carried out on these forms and the instructions refer to the boxes. Copies of the form are bound in the back of Admiralty Tide Tables.

Example I. *To find the time and height of HW and LW at a Secondary Port*

I. Complete heading of the Tidal Prediction Form.

II. Transfer data from ATT Part I to boxes (1), (2), (3) and (4).

III. Interpolate data from ATT Part II and insert in boxes (7), (8), (9) and (10).

IV. Enter Seasonal Changes for Standard and Secondary Ports from ATT Part II in boxes (6) and (11).

V. Apply results of Steps III and IV to obtain boxes (12), (13), (14) and (15).

Example:

Find the time (BST) and height of the afternoon HW and LW at ST. MARY'S (Isles of Scilly) on 14th July.
Note: The data used in this example do not refer to the year of these tables.

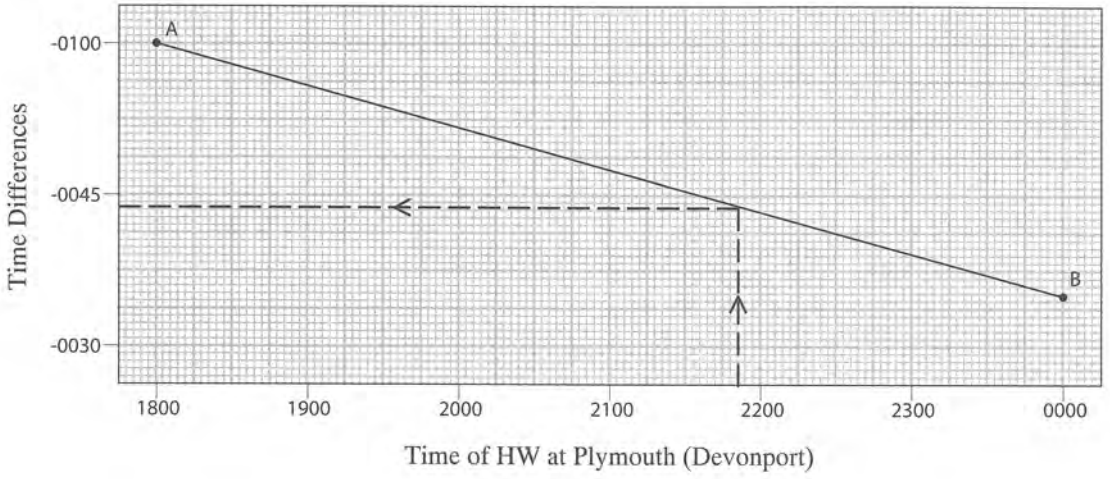
HW 2105 GMT = 2205 BST

SECONDARY PORT TIME AND HEIGHT DIFFERENCE INTERPOLATION

In most cases interpolation can be carried out by eye. For complex examples or where greater accuracy is required the use of a pocket calculator may be preferred. These interpolations can also be shown graphically at any convenient scale.

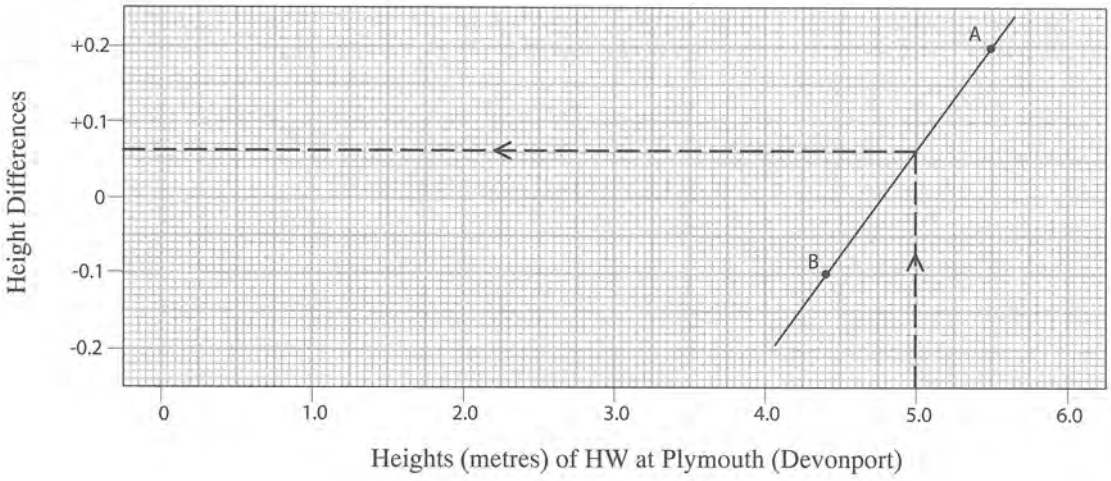
Plot the two High Water time differences A (-0100 at 1800) and B (-0035 at 0000) and join AB. Read off the time difference for St. Mary's corresponding to a HW time at Plymouth (Devonport) of 2149 = -0044.

In a similar way plot the two Low Water time differences (-0040 at 1200) and (-0025 at 1800) and derive the time difference for St. Mary's corresponding to a LW time at Plymouth (Devonport) of 1532 = -0031.



The height difference can be plotted in the same way. Plot A (MHWS of 5.5 and +0.2) and B (MHWN of 4.4 and -0.1). Draw a line through A and B. Read off the height difference for St. Mary's corresponding to a height at Plymouth (Devonport) of 5.0m = +0.1m.

In a similar way plot the two Low Water height differences (MLWN of 2.2 and -0.2) and (MLWS of 0.8 and -0.1) and derive the height difference for St. Mary's corresponding to a height at Plymouth (Devonport) of 1.1m = -0.1m.



Example II. *To find the height at a given time (Standard Port)*

I. On Standard Curve diagram, plot heights of HW and LW occurring either side of required time and join by sloping line.

II. Enter HW time and sufficient others to embrace required time.

III. From required time, proceed vertically to curves, using heights plotted in I to assist interpolation between springs and neaps. Do NOT extrapolate.

IV. Proceed horizontally to sloping line, thence vertically to height scale.

V. Read off height.

Example:

Find the height of tide at ULLAPOOL at 1900 on 6th January.

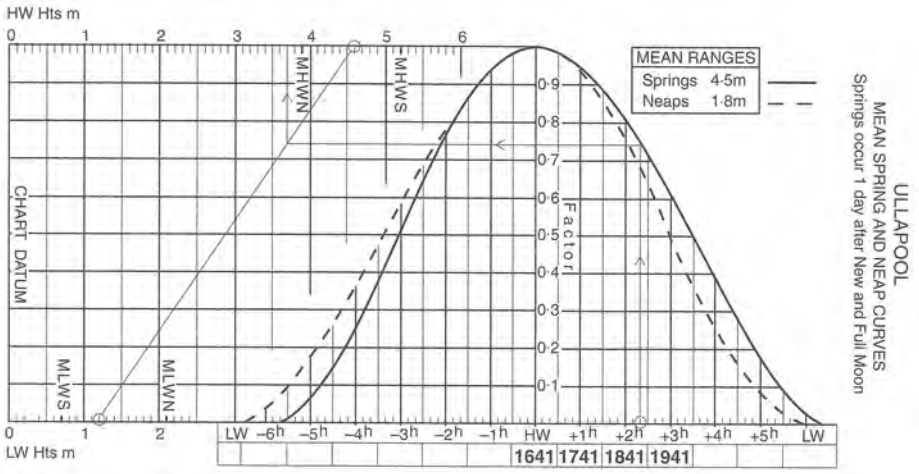
Note: The data used in this example do not refer to the year of these tables.

Extract from ATT Part I.

JANUARY

6 0420 4.6
1033 1.6
F 1641 4.6
2308 1.2

ULLAPOOL



height 3.7m

Example III. *To find the time for a given height (Standard Port)*

I. On Standard Curve diagram, plot heights of HW and LW occurring either side of required event and join by sloping line.

II. Enter HW time and those for half-tidal cycle covering required event.

III. From required height, proceed vertically to sloping line, thence horizontally to curves, using heights plotted in I to assist interpolation between springs and neaps. Do NOT extrapolate.

IV. Proceed vertically to time scale.

V. Read off time.

Example:

Find the time at which the afternoon tide at ULLAPOOL falls to 3·7 m on 6th January.

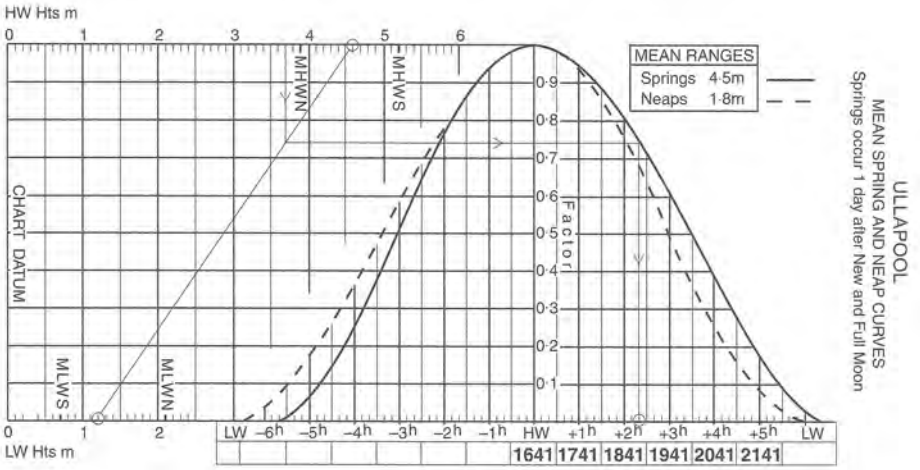
Note: The data used in this example do not refer to the year of these tables.

Extract from ATT Part I.

JANUARY

6	0420	4.6
	1033	1.6
F	1641	4.6
	2308	1.2

ULLAPOOL



Time 1900

Examples IV and V. Intermediate Times/Heights (Secondary Port)

These are the same as the appropriate calculations for a Standard Port (Examples *II* and *III*) except that the Standard Curve diagram for the Standard Port must be entered with HW and LW heights and times for the Secondary Port obtained on the Tidal Prediction Form (Example *I*). When interpolating between the spring and neap curves (see para. III of Examples *II* and *III*) the range at the Standard Port must be used.

Examples:

Find the height of the tide at PADSTOW at 1100 on 28th February. Find the time at which the morning tide at PADSTOW falls to 4.9m on 28th February.

Notes: The data used in these examples do not refer to the year of these tables.
For Instructions on graphical interpolation of differences, see page xx.

Time 1100

SPECIAL INSTRUCTIONS FOR PLACES BETWEEN SWANAGE AND SELSEY

Owing to the rapid change of tidal characteristics and distortion of the tidal curve in this area curves are shown for individual ports. It is a characteristic of the tide here that low water is more sharply defined than high water and these curves have therefore been drawn with *their times relative to that of* ***low water***. The curves appear on pages xxvii to xxix.

Apart from differences caused by referring the times to low water the procedure for obtaining intermediate heights at places whose curves are shown on pages xxvii to xxix is identical to that used for normal Secondary Ports.

The height differences in Part II for ports between Bournemouth and Yarmouth always refer to the higher high water, i.e. that which is shown as reaching a factor of 1.0 on the curves. Note that the time differences which are not required for this calculation, also refer to the higher high water.

The tide at ports whose curves appear on page xxvii shows considerable change of shape and duration between springs and neaps and it is not practical to define the tide with only two curves. A third curve has therefore been drawn for the range at Portsmouth at which the two high waters are equal at the port concerned - this range being marked on the body of the graph. Interpolation here should be between this "critical" curve and either the spring or neap curve as appropriate. It will be noticed that while the critical curve extends throughout the tidal cycle the spring and neap curves stop at the higher high water. Thus for a range at Portsmouth of 3.5 m the factor for 7 hrs after low water at Bournemouth should be referred to the following low water, whereas had the range at Portsmouth been 2.5 m it should be referred to the preceding low water.

Notes:

1. NEWPORT. Owing to the constriction of the River Medina, Newport requires slightly different treatment since the harbour dries out at 1.4 m. The calculation should be performed using the Low Water times and heights for Cowes and the High Water height differences for Newport. Any calculated heights which fall below 1.4 m should be treated as 1.4 m.
2. WAREHAM and TUCKTON. Low Waters do not fall below 0.7 m except under very low river flow conditions.

Example VI. *To Find the Height at a given time at a Secondary Port between Bournemouth and Selsey*

I. Complete top section of the Tidal Prediction Form. Omit HW time column (Boxes 1, 7, 12).
II. On Standard Curve diagram, plot Secondary Port HW and LW heights and join by sloping line.
III. From time required, using Secondary Port LW time, proceed vertically to curve, interpolating as necessary using range at Portsmouth. Do NOT extrapolate.
IV. Proceed horizontally to sloping line, thence vertically to height scale.
V. Read off height.

Example:

Find the height of tide at BOURNEMOUTH at 0200 on 18th November.

Notes: The data used in this example do not refer to the year of these tables.
For Instructions on graphical interpolation of differences, see page xx.

CONNECTION BETWEEN CHART DATUM AND LAND SURVEY DATUM

In order to determine the manner in which tidal levels vary along any given stretch of coastline, it is necessary to refer all levels to a common horizontal plane. Chart Datum, being dependent on the range of the tide, which varies from place to place, is not a suitable reference plane.

Ordnance Datum (Newlyn) can be regarded as a horizontal plane and, where comparisons of absolute heights are required on the mainland of England, Scotland and Wales, this should be used. The earlier Land Levelling System, based on Liverpool, is now obsolete and should not be used. Other countries have their own Land Survey Datum.

If absolute heights are required at a point on the coast where no tidal data are given, or where there is no connection given to Land Survey Datum they should be obtained by interpolation from heights obtained from places on either side where the necessary data are available.

Table III gives the connection between Chart Datum and Ordnance Datum (Newlyn) for all Standard Ports and many Secondary Ports in the United Kingdom, while Table IV gives the equivalent figures for other countries.

Example: It is required to find the height of MHWS above Ordnance Datum (Newlyn) at Happisburgh and Mundesley. This can be done by interpolation between Winterton-on-Sea and Cromer.

	Winterton	Cromer
MHWS above Chart Datum (Part II)	3.2	5.2
Chart Datum relative to OD(N) (Table III)	-1.8	-2.7
MHWS relative to OD(N)	+1.4	+2.5

Happisburgh is approximately half and Mundesley approximately three-quarters of the distance between Winterton and Cromer. By inspection, therefore, the height of MHWS at Happisburgh is +2.0(N) and at Mundesley +2.2(N).

When interpolating along the open coast, care must be taken to choose places where tidal levels are not impounded by bars or narrow entrances or unduly affected by river water. At Exmouth and Littlehampton, for example, the absolute heights of MLWS are higher than the values for the open coast, due to impounding.

Results obtained by this method are approximate only. More accurate information is often available either from the United Kingdom Hydrographic Office or from the National Land Survey Office.

This variation of the Simplified Harmonic Method of Tidal Prediction has been designed primarily for use with a pocket calculator. When performed in this manner there will be no saving in time required to predict a full 24 hours but there will be a slight gain in accuracy (see also note 4). However this method is probably quicker when only a short period of prediction is required, and prediction at fractions of an hour are easier. The box diagram has also been found useful to assist in programming a pocket calculator and to assist in this some additional notes have been added.

DETAILED INSTRUCTION FOR MANUAL COMPLETION OF FORM

The example shows the number of decimal places required.

Section A. To be completed once for each day on which predictions are required.

1. Complete heading section (Port, No., Date and Time Zone).
2. From ATT Part III enter:
   - Z_o (or from Tab VI) ..... Line 1
   - Seasonal Change ..... Line 2
   - Values of g ..... Line 11
3. From ATT, Tab VII enter:
   - Values of A on required day (A1) ..... Lines 4 and 10
   - Values of A on succeeding day (A2) ..... Line 5
   - Values of F on required day (F1) ..... Line 14
   - Values of F on succeeding day (F2) ..... Line 13
4. Sum Lines 1 and 2 to obtain days value of Mean Level in Line 3.

For each column in turn:

5. Obtain Line 6 by subtracting A2 from A1 .
6. Enter 360.n in Line 7. (See note under section A and Note 5).
7. Add Lines 6 and 7 to obtain daily rate of change of A (p) in Line 8.
8. Insert p/24 in Line 9.
9. Add Lines 10 and 11 to obtain (A1 +g) in Line 12.
10. Subtract Line 14 from Line 13 to obtain daily rate of change of F (P) in Line 15.
11. Insert P/24 in Line 16.

Section B. To be completed for each time for which a prediction is required.

12. Enter Time (T) in Line 17. If your calculator has not got conversion between Hrs/Mins/Sec and Dec. Hrs it is probably best to work in decimals e.g. 1812=18.2.
13. From ATT Part III enter:

Values of H		Line 28.
f_4	If no data are given, enter zero	Line 35 Col 1
F_4		Line 35 Col 2
f_6		Line 38 Col 1
F_6		Line 38 Col 2

14. From Section A enter:

p/24 (Line 9)	Line 18
(A1+g) (Line 12)	Line 20
P/24 (Line 16)	Line 24
F1 (Line 14 or direct from ATT Tab VII)	Line 26
ML (Line 3)	Line 33 Col 4

15. Multiply p/24 by T in Line 19.
16. *Subtract* (see note 4) Line 19 from Line 20 to obtain θ in Line 21.
17. Enter Sin θ in M_2 and S_2 columns only of Line 22.
18. Enter Cos θ in all columns of Line 23.
19. Multiply P/24 by T in Line 25 and add to Line 26 to obtain interpolated value of F (=Ft) in Line 27.
20. Multiply H (Line 28) by Ft (Line 27). Enter result in Line 29.
21. Multiply Line 29 by Line 22 to obtain H.Ft.sin θ in M_2 and S_2 columns only.
22. Multiply Line 29 by Line 23 to obtain H.Ft.cos θ. Insert results for M_2, S_2 and O_1 in appropriate columns of Line 31. Insert result for K_1 in Line 30 (Col 4).

N.B.From here on the columns no longer refer to H.C.s and are referred to by their numbers.

23. Sum columns 1 and 2 of Line 30 and enter in Line 32, Col 1 (=R.sin r).
24. Sum columns 1 and 2 of Line 31 and enter in Line 32, Col 2 (=R.cos r), and Col 4.
25. From R.sin r and R.cos r obtain values of r (Line 33, Col 1) and R (Line 33 Col 2).
26. Obtain 2r in Line 34, Col 1 and 3r in Line 37, Col 1.
27. Obtain R^2 in Line 34 Col 2 and R^3 in Line 37 Col 2.
28. Add Lines 34 and 35 (Col 1) to obtain d_4 in Line 36.
29. Add Lines 37 and 38 (Col 1) to obtain d_6 in Line 39.
30. Multiply Lines 34 and 35 (Col 2) to obtain D_4 in Line 36.
31. Multiply Lines 37 and 38 (Col 2) to obtain D_6 in Line 39.
32. Obtain D_4.cos d_4 and insert in Line 36, Col 4.
33. Obtain D_6.cos d_6 and insert in Line 39, Col 4.
34. Finally sum Col 4, Lines 30, 31, 32, 33, 36 and 39; enter the result in Line 40.

Notes.

1. It is strongly recommended that calculations should bracket the required time and the results be plotted on any suitable squared paper. A single prediction is seldom of value as it gives no indication of the rate of rise or fall (in complicated ports it will not even be possible to ascertain whether it is rising or falling).

2. Although the box diagrams allow for entry of every step the capabilities of the calculator and the skill of the operator may enable many boxes to be left blank or placed in Memory. POLAR/RECTANGULAR conversion is particularly valuable and with this facility one can go from Line 17 to 31 without any intermediate writing down and with no ambiguity of quadrant.

3. In many cases interpolation between F1 and F2 can be carried out with sufficient accuracy by eye thus enabling Lines 13, 14, 15, 16, 24 and 25 to be omitted.

4. In order to simplify the calculation (or if being programmed to save steps and/or stores) the following approximations may be made. These are given in the order of their effect on the accuracy that with the least effect being given first:

(a) Omit lines 4 to 9. Insert the following rates in Line 18:

M_2	29.0 deg/hr
S_2	30.0 deg/hr
K_1	15.0 deg/hr
O_1	13.9 deg/hr

(b) As (a) but using the following rates:

M_2, S_2 } -29.32 deg/hr.

K_1, O_1 } -Half this figure i.e. 14.66 deg/hr.

(c) Omit interpolation of F. Hence omit Lines 13, 14, 15, 16, 24, 25 and 26 and insert Ft=F (direct from ATT Tab VII) in Line 27.

5. *Interpolation Between Tabulated Values of A and F.*

The hourly rates of change of A for each constituent can be calculated from consecutive tabulated values, care being taken to apply sufficient multiples of 360° to the tabulated values to ensure that these rates approximate to the astronomical values for each constituent - i.e. 30 deg/hr for M_2 and S_2 and 15 deg/hr for K_1 and O_1. This can be done as follows:

$$\text{Daily Rate } (p)=(A1+360.n) - A2$$

where n=o or the smallest integer which makes p>600 in the case of M_2 and S_2 and p>300 in the case of K_1 and O_1. Then for each of the four constituents:

$$At=A1 - (T \times p)/24$$

(The values of A in Table VII are published in a form designed to simplify the arithmetic of the original graphical version of the Simplified Harmonic Method of Tidal Prediction (the tabulated value is 360° minus the astronomical value). The second term in the above expression is, therefore, SUBTRACTED.)

The interpolation for F for any given time is simpler:

$$Ft=F1 +(T \times P)/24 \text{ where } P=F2-F1$$

6. *Vectorial Addition of SD components*

The SD tide (R, r) at any time consists of the sum of the M_2 and S_2 tides. Thus:

$R.\sin r=H.Ft.\sin(At+g)$ for $M_2+H.Ft.\sin(At+g)$ for S_2

$R.\cos r=H.Ft.\cos(At+g)$ for $M_2+H.Ft.\cos(At+g)$ for S_2

and from this R and r may be obtained. If using a programmed calculator POLAR/RECTANGULAR conversion *must* be used to avoid ambiguity of sign or quadrant, but if the calculation is being done manually ordinary trig (and inverse trig) functions may be used provided great care is taken to resolve this ambiguity.

Shallow Water Corrections

The quarterdiurnal tide has phase ..... $d_4 = 2r+f_4$

and amplitude ..... $D_4 = R^2 \times F_4$

and the height correction due to the

quarterdiurnal effect ..... $h_4 = D_4.\cos d_4$

The sixthdiurnal tide has phase ..... $d_6 = 3r+f_6$

and amplitude ..... $D_6 = R^3 \times F_6$

and hence height ..... $h_6 = D_6.\cos d_6$

h4 and h6 must be summed algebraically to the combined SD and D tide to give a corrected height for the required time.

ADDITIONAL NOTES MORE APPLICABLE TO PROGRAMMABLE CALCULATORS

7. Although the boxes show a possible route through the problem this may not be the best route for every calculator.

8. If storage is limited, parameters can often be combined and placed each side of the decimal place after application of suitable multipliers e.g. g and H can be stored together: thus a g of 312 and H of 2.45 might be stored as 312.245. Strangely in some cases this not only reduces the number of stores required but also the program steps.

9. Given sufficient facilities on the calculator the following are recommended:
   (a) Automatic stepping of TIME at both fixed and variable intervals.
   (b) Ability to change Start Time of a series of predictions.
   (c) Prediction of successive days without re-entry of Harmonic Constants for each day.
   (d) Prediction for second port on same day without re-entry of astronomical data (A and F)
   (e) Recording of Harmonic Constants for any port. Steps should be allocated for amendment of carded data to allow for any changes.

Although possible to program for the derivation of a time of HW or of LW this has been found to be of little value. In a large number of ports where this method is of greatest use the curve may be so flat at these points that the actual time derived is meaningless: at ports where a double HW or LW or intermediate stand occurs there may well be ambiguity as to the point on the curve obtained. In most cases it is preferable to plot a short portion of the curve from the results of successive calculations.

10. It is sometimes more convenient to work in centimetres rather than metres provided there are no Shallow Water Corrections.

NOTES

No.	
21-33	Between Start Point and Portland the tidal curve gradually becomes more and more distorted, especially on the rising tide; the rise is relatively fast for the first hour after low water and there is then a noticeable slackening in the rate of rise for the next 1½ hours, after which the rapid rate of rise is resumed. There is often a "stand" at high water, which, while not very noticeable at Start Point, lasts for about an hour at Torquay and for 1½ hours at Lyme Regis.
34	Double low waters occur between Portland and Lulworth Cove. Data for Lulworth refer to the first low water.
35-70	Owing to the complicated variations in the tide between Portland and Portsmouth, the time and height differences for these places will only give approximate predictions. A more accurate representation of the tidal curves at these places can be obtained from the diagrams on pages xxvii to xxix.
35-38	From Swanage to Christchurch double high waters occur except at neaps. High water differences refer to the higher high water when there are two and are approximate.
36-36d	In Poole Harbour the tide is above mean level from about 2 hours after low water to 2 hours before the next low water. Strong and continuous winds from east through south to south-west may raise sea levels by as much as 0.2 m while winds from west through north to north-east may lower levels by 0.1 m. Barometric pressure effects are also appreciable - see page xii.
36a	At Poole (RoRo Terminal) the height of the second high water is always about 1.8 m. Only the height of the first high water varies from springs to neaps.
38	Tidal levels at Christchurch (Entrance) are for a position inside the bar; outside the bar the tide falls about 0.6 m lower at springs. The tide is above mean level from about 3 hours after low water to 2½ hours before the next low water.
39-48	In the approaches to and within the Western Solent double high waters occur at or near springs; on other occasions there is a stand which lasts about 2 hours. The time differences refer to the first high water when there are two and are approximate.
62	With a north-east gale and a high barometer, tidal heights at Southampton may be as much as 0.6 m less than predictions.
61-63a	For intermediate heights use the Standard Curve for Southampton on page 30.
65	Strong winds between north-east and south-east coupled with high barometric pressures may reduce predicted levels by up to 1 m and delay times of high and low waters by up to 1 hour. Strong winds from the West coupled with low barometric pressures may increase predicted levels and advance predicted times by a similar amount.
74	Tidal heights inside Littlehampton Harbour are affected by the water coming down the River Arun; the tide seldom falls lower than 0.7 m above datum.
110-116	River water has a marked effect on tidal levels in the river Thames, especially in the upper reaches. The levels given are for a mean flow of 18 cumecs at Teddington Weir. Flows of 650 cumecs have been recorded and, for the latter figure, levels at London Bridge will be approximately 0.3 m higher than predictions. The effect decreases down the river and is not noticeable at Southend. Similarly, abnormally low flows can be expected to reduce tidal levels. When the Thames Flood Barrier is closed, levels upstream of the Barrier will be markedly different from predictions.

NOTES

No.	
115a, 116	Water levels between Kew Bridge and Richmond Lock will, under low flow conditions, remain at or less than chart datum from up to 3 hours before to 1 hour after the time of predicted low water at Richmond Lock. Low water levels of 0.5 m below chart datum are not uncommon.
116	Above Richmond Lock, as far as Teddington Weir, low water level is maintained at 1.72 m above Ordnance Datum (Newlyn) by the weir at Richmond.
116a-121	Predictions for other places in the Thames Estuary should be obtained from the co-tidal charts contained in "Thames Estuary-Tidal Stream Atlas and Co-tidal Charts" (NP 249). For details see page 368.
142-144	Between Winterton-on-Sea and Great Yarmouth the rise of the tide occurs mainly during the 3½ hours following low water. At Winterton-on-Sea the level is usually within 0.3 m of the predicted high water height from 4 hours before high water at Lowestoft until 1 hour before high water at Lowestoft. At Caister-on-Sea, where double high waters sometimes occur, and at Great Yarmouth the level is usually within 0.3 m of the predicted high water height from 3 hours before high water at Lowestoft until high water at Lowestoft.
157a	Low water time differences at Wells are for the end of a low water stand which lasts about 4 hours at springs and about 5 hours at neaps.
177	At Burton Stather, normal river level is about 0.1 m below chart datum.
178	At Keadby, normal river level is between 0.1 m and 0.2 m below chart datum. The tide is normally at or just below chart datum for ½ to 1½ hours; low water time differences are for the beginning of the rise.
179, 180	At Blacktoft and Goole the amount of fresh water coming down the rivers has little effect on the heights of high water. The levels for low water are given for a low rate of river flow. High rates of river flow can increase the level of low water by as much as 0.3 m at Blacktoft and 0.6 m at Goole.
208	The causeway can be used by motor vehicles from 3½ hours after to 2 hours before high water. Adverse weather conditions may shorten the period during which it is usable.
236b	At Perth the low water time differences give the beginning of the rise, following a low water stand of about 4 hours.
381-390	In the Sound of Jura, south of Loch Crinan, the rise of tide occurs mainly during the 3½ hours following low water, and the fall during the 3½ hours following high water. At other times the changes in level are usually small and irregular. In the vicinity of the amphidromic point, predictions using the data in Part II may produce significant differences compared to those using harmonic constants, especially at neaps when the diurnal inequality becomes pronounced. At Port Ellen weather conditions have a marked effect on sea level, southerly and easterly gales raising the level up to 1 m; at neaps the tide is sometimes diurnal, while the range is negligible. At Machrihanish the difference between springs and neaps is not more than 0.2 m.
426-431	The time differences given for low water are for the beginning of the rise which is very sudden at springs.
442	Low water time differences at Glasson Dock give the end of a low water stand which lasts up to 2 hours at springs.
446	Low water time differences at Preston give the end of a low water stand which lasts about 3½ hours.

NOTES

No.	
462	Levels are given for a mean flow of 10 cumecs at Chester Weir. Flows of 180 cumecs have been recorded and, for this figure, levels at Chester will be 0.7 m at springs and 1.9 m at neaps higher than predictions. The effect decreases down the river and is not noticeable at Connah's Quay. A bore occurs in the River Dee at Chester.
463	Low water time differences at Connah's Quay give the end of a low water stand which lasts for 3½ to 4 hours at springs and for 4½ to 5½ hours at neaps. In the dock, impounded low water level is 0.7 m above chart datum.
515	The height of low water at Newport does not normally fall below MLWS; tidal heights are calculated for an average minimum flow; maximum river flow may raise the height of low water by as much as 0.3 m.
516	The effect of the tide in the river Wye is felt as far as St. Briavel, where the height of MHWS is about 8 m above Ordnance Datum (Newlyn), when the river flow at Redbrook is 21 cumecs. At St. Briavel the tidal range at springs may be as much as 1.8 m, but changes in level due to river water may be greater than this.
519-522b	Above Inward Rocks the height of low water is greatly affected by the amount of fresh water coming down the river Severn and its tributaries. The tidal levels given are for a low rate of river flow (about 35 cumecs at Wellhouse Rock). Flood water can increase the height of low water by as much as 0.6 m to 1 m but the height of high water is scarcely affected by river flow except, perhaps, for freak conditions which occur less than once a year.
522c-522e	Time and height differences refer to springs only. At neaps, the river in this area is non-tidal. The Bore on the River Severn can usually be seen when the range of the tide at Avonmouth is 13.5 m or more . It usually arrives at Minsterworth about 45 minutes and at Stonebench about 60 minutes after the time of High Water at Avonmouth. For further information, see West Coasts of England and Wales Pilot (NP 37).
529	At Bridgwater, the tide falls to normal river level, which is about 1.8 m above Ordnance Datum (Newlyn). Low water time differences give the end of the low water stand, which lasts for 1½ to 2½ hours at springs and 7½ to 8½ hours at neaps. The onset of the rising tide is often accompanied by a bore.
536-540	Rivers Taw and Torridge: At Fremington there is a low water stand of 2 to 2½ hours at springs; the 0100/1300 low water time difference gives the beginning of the stand. At neaps there is no stand. At Barnstaple there is a low water stand lasting until 1 hour 45 minutes before high water. The low water time differences give the beginning of the stand. At Bideford there is a low water stand lasting for 2 to 3 hours at springs. The low water time difference gives the beginning of the stand. Meteorological conditions have a considerable effect on the heights of high and low water. Levels given for MLWS are those below which the tide will not fall.
545a	The low water time differences give the beginning of the rise which follows a low water stand of about 5 hours.
718	Strong winds between south and west increase the height and delay the times of high water. Strong winds between north and east have the opposite effect.
1503, 1505-1509 1512, 1521	Double low waters occur on the coast of the Netherlands between Scheveningen and Haringvlietsluizen and in the entrances to the River Rhine as far upstream as Krimpen and Spijkenisse. They are more pronounced at springs; on occasions when they do not occur, there is still a considerable distortion of the tidal curve which takes the form of a low water stand. The slight rise after the first low water is known as the agger. Predictions for the Standard Ports of Hoek van Holland and Rotterdam are for the *lower* low water. The *first* low water occurs about 5½ hours after high water and the *second* low water about 4 hours before the following high water. Time differences for low water refer to the *first* low water for Nos. 1505 & 1521 and to the *second* low water for Nos. 1503, 1506-1509 and 1512.

NOTES

No.

1506-1520a On the tidal rivers water levels are considerably affected by river water; at Lobith there is no tidal effect but the river level varies by as much as 6 m; the effect of river water gradually decreases down the river but is of importance as far as Dordrecht. The differences given are for a river level of 9.8 m above NAP at Lobith *two days earlier*. Predictions for Dordrecht should be corrected according to the following table:

	m	m	m	m
River level at Lobith *two days earlier*	7.7	9.8	12.7	13.9
Correction to high water time (minutes)	-10	0	+20	+35
Correction to low water time (minutes)	-10	0	+20	+30
Correction to high water height (metres)	-0.2	0.0	+0.1	+0.2
Correction to low water height (metres)	-0.2	0.0	0.0	0.0

1582a-1588 In La Seine, there is a high water stand, within 0.2 m of the maximum, which lasts for about 2 hours 50 minutes as far up as Vatteville, decreasing to about 1 hour 50 minutes at Duclair. The high water time differences refer to the beginning of the stand.

1590-1592 A double high water exists at Trouville, Dives and Ouistreham. The high water time differences referred to the published time of high water at Le Havre give the times of the first high water.

GEOGRAPHICAL INDEX

TIDE TABLES 2013

INSTRUCTIONS FOR THE USE OF TABLES

TO FIND THE TIMES AND HEIGHTS OF HIGH AND LOW WATER

Standard Ports

The times and heights of high and low water are tabulated for every day of the year. The zone time used for the predicted times is usually the standard time for the area and is given at the top of each page. Care should be taken to ensure that this is the actual time zone in use on that date, the predicted time being corrected if necessary. Special care is needed for those ports whose time is changed during the year.

The heights are shown in metres referred to the chart datum of the port concerned.

Secondary Ports

The times of high and low water are obtained by applying the time differences tabulated in Part II to the daily prediction for the most suitable (not necessarily the closest) Standard Port. The Standard Port to be used is that which appears in **bold type** at the head of the subsection in Part II. Other Standard Ports may occur within a subsection in their correct geographical sequence but full data for these are not shown. The times obtained by applying these corrections are in the time zone shown next above the Secondary Port irrespective of the zone time used for the Standard Port predictions.

The heights of high and low water are obtained by applying the height differences tabulated in Part II to the daily predictions for the same Standard Port as is used for the times. For places where the tide is mainly semi-diurnal in character these differences are tabulated for the Mean Spring and Mean Neap levels at the Standard Port. Where the diurnal inequality is large, the tabulations are made for Mean Higher and Mean Lower, High and Low Water. In either case, unless there is a statement to the contrary in Part II it may be assumed that the variation is linear and differences for heights other than those tabulated may be obtained by interpolation or extrapolation. It MUST be noted that the predictions for Standard Ports include the seasonal changes for the Standard Port which may be different from those for the Secondary Port. The seasonal changes tabulated in Part II (and Part III) are shown for the first day of each month (i.e. Jan 1 is the first of January, and so on). They should be suitably interpolated for the day of prediction. The first step is therefore to SUBTRACT algebraically the seasonal change for the Standard Port from the predicted height obtained from Part I. The next step is to apply the height difference corresponding to this corrected height at the Standard Port, interpolating or extrapolating as necessary. The final step is to ADD algebraically the seasonal change for the Secondary Port. In both cases great care must be taken to ensure that the signs of the seasonal changes are correctly applied. Where no seasonal changes are given they are less than 0.1m and can be ignored. Allowance has been made in the preparation of the tables for any difference in the level of chart datum between the Standard and Secondary Port and the resulting heights are referred to chart datum at the Secondary Port concerned.

For certain ports the time differences are replaced by "*p*" indicating that no suitable Standard Port is available and predictions can only be made by using the Simplified Harmonic Method of Tidal Prediction. Height differences are included for these ports to enable tidal levels to be obtained but they should not be used for obtaining daily predictions.

TO FIND THE HEIGHT OF TIDE AT TIMES BETWEEN HIGH AND LOW WATER

The Standard Curves on page xxii show the factor of the range attained at a given time interval relative to that of HW for durations between 5 and 7 hours. They are based on the assumption that the tide approximates to a cosine curve.

These curves will give acceptable results, using interpolation between adjacent curves for the actual duration where necessary, provided that *both* the following criteria are satisfied:

(a) The duration of rise or fall must lie within the scope of the graphs i.e. between 5 and 7 hours.

(b) There must be no shallow water correction (f_4, F_4, f_6 and F_6) shown in Part III.

If either of these criteria is not met, intermediate heights must be predicted by the use of the Simplified Harmonic Method of Tidal Prediction.

Owing to the relatively small number of constituents used, the Simplified Harmonic Method of Tidal Prediction may produce predictions, for a Standard Port, which differ from those obtained in Part I. Times and heights from Part I should also be plotted on a graph of the results of calculations by the Simplified Harmonic Method of Tidal Prediction and this curve then adjusted to pass through the Part I predictions.

See page xxiii for instructions on the use of calculators and the Simplified Harmonic Method of Tidal Predictions and forms A and B at the back of the book.

MEAN LEVELS

The values of MLWS, MLWN, MSL, MHWN and MHWS are shown for Standard Ports in Table V and Part II where the tide is mainly semi-diurnal. Where there is large diurnal inequality the values of MLLW, MHLW, MSL, MLHW and MHHW are shown. The equivalent values for Secondary Ports may be found by the direct application of the appropriate height differences tabulated in Part II.

HIGHEST AND LOWEST LEVELS

The values of HAT and LAT for Standard Ports are shown in Table V Part 1. The values of HAT for Secondary Ports are shown in Table V Part 2. The values of LAT at Secondary Ports may be *inferred* by linear extrapolation beyond the given height differences tabulated in Part II for a tide that reaches the appropriate level at the Standard Port using the graphical solution for the examples on the following pages.

OFFSHORE AREAS AND PLACES BETWEEN SECONDARY PORTS

Tidal predictions for offshore areas and stretches of coastline between Secondary Ports should be obtained by the use of Co-Tidal Charts. For details of Co-Tidal Charts available see page 359 and the Catalogue of Admiralty Charts. Full instructions for their use are contained on the body of the charts.

DETAILED INSTRUCTIONS AND EXAMPLES

The Tidal Prediction Form is a convenient form for the majority of time and height calculations. The examples have been carried out on these forms and the instructions refer to the boxes. Copies of the form are found in the back of Admiralty Tide Tables.

THE SIMPLIFIED HARMONIC METHOD OF TIDAL PREDICTION

This method of prediction uses the Harmonic Constants published in Part III of these Tables and the Tidal Angles and Factors from Table VII. The application of Table VII to the four main constituents revises them for the date concerned and modifies them to allow for the effects of a number of related constituents. When the Shallow Water Corrections, Seasonal Corrections and Table VI are also used the prediction obtained is equivalent to one using 36 harmonic constituents. Of course, for many ports not all the above corrections are needed and for them only the necessary data are published. Instructions for use with programmable computers or calculators, with a worked example, are included on pages xxiii to xxv.

This method may also be used in the prediction of tidal streams, and harmonic constants are included in Part IIIa for this purpose. The constants are used in exactly the same way as for tidal predictions with the values of "H" given in knots instead of metres. For those positions where appropriate the tidal stream is assumed to run in two opposing directions, and the results obtained from the Simplified Harmonic Method give hourly rates in the positive or negative direction. The compass courses given for each direction in Part IIIa give the directions *towards which* the stream is predicted to run. For those positions where the stream is rotary, constants are given for both the north and east components. When hourly values of the stream for each component have been found, it is necessary to combine them to obtain the rates and directions towards which the stream is running at each time.

Example I: To find the times and heights of high and low waters at "Secondary Port" (semi-diurnal tides) on 16th January, using the following extracts.

Extract from ATT Part II.

PLACE	Lat	Long	TIME DIFFERENCES MHW	MLW	HEIGHT DIFFERENCES (IN METRES) MHWS	MHWN	MLWN	MLWS
STANDARD PORT	(see extract)				**2.5**	**1.8**	**1.2**	**0.4**
	S	**W**						
Secondary Port	2 45	8 15	-0015	-0025	-1.2	-0.8	-0.4	+0.1

SEASONAL CHANGES IN MEAN LEVEL

No	Jan 1	Feb 1	Mar 1	Apr 1	May 1	June 1	July 1	Aug 1	Sep 1	Oct 1
STANDARD PORT	-0.1	0.0	0.0	+0.1	+0.2	+0.2	+0.1	0.0	-0.1	-0.1
Secondary Port	0.0	+0.2	+0.1	+0.2	+0.2	+0.1	0.0	-0.1	-0.2	-0.1

Notes: (i) The data used in this example do not refer to the year of these tables.

(ii) Computation of HW height differences is done by interpolation or extrapolation, using the two values tabulated for HW and the height of HW at the Standard Port. Similarly, LW height differences are computed from the data given for LW. In most cases, this can be carried out by eye. However, the use of a pocket calculator may be preferred. Alternatively, it may be carried out graphically, as shown below.

Plot A (MHWS 2.5, difference -1.2) and B (MHWN 1.8, difference -0.8).

Draw a line through A and B. Read off the height differences for Secondary Port corresponding to the corrected heights at Standard Port of 1.8 and 2.2 - i.e. -0.8 and -1.0.

Similarly, plot the LW height differences to get Secondary Port differences corresponding to the corrected heights at Standard Port of 0.9 and 1.3 - i.e. -0.2 and -0.5.

Extract from ATT Part I.

This variation of the Simplified Harmonic Method of Tidal Prediction has been designed primarily for use with a pocket calculator. When performed in this manner there will be no saving in time required to predict a full 24 hours but there will be a slight gain in accuracy (see also note 4). However this method is probably quicker when only a short period of prediction is required, and prediction at fractions of an hour are easier. The box diagram has also been found useful to assist in programming a pocket calculator and to assist in this some additional notes have been added.

DETAILED INSTRUCTION FOR MANUAL COMPLETION OF FORM

The example shows the number of decimal places required.

Section A. To be completed once for each day on which predictions are required.

1. Complete heading section (Port, No., Date and Time Zone).
2. From ATT Part III enter:
   - Z_o (or from Tab VI) ..... Line 1
   - Seasonal Change ..... Line 2
   - Values of g ..... Line 11
3. From ATT, Tab VII enter:
   - Values of A on required day (A1) ..... Lines 4 and 10
   - Values of A on succeeding day (A2) ..... Line 5
   - Values of F on required day (F1) ..... Line 14
   - Values of F on succeeding day (F2) ..... Line 13
4. Sum Lines 1 and 2 to obtain days value of Mean Level in Line 3.

For each column in turn:

5. Obtain Line 6 by subtracting A2 from A1 .
6. Enter 360.n in Line 7. (See note under section A and Note 5).
7. Add Lines 6 and 7 to obtain daily rate of change of A (p) in Line 8.
8. Insert p/24 in Line 9.
9. Add Lines 10 and 11 to obtain (A1 +g) in Line 12.
10. Subtract Line 14 from Line 13 to obtain daily rate of change of F (P) in Line 15.
11. Insert P/24 in Line 16.

Section B. To be completed for each time for which a prediction is required.

12. Enter Time (T) in Line 17. If your calculator has not got conversion between Hrs/Mins/Sec and Dec. Hrs it is probably best to work in decimals e.g. 1812=18.2.
13. From ATT Part III enter:

Values of H		Line 28.
f_4	If no data are given, enter zero	Line 35 Col 1
F_4		Line 35 Col 2
f_6		Line 38 Col 1
F_6		Line 38 Col 2

14. From Section A enter:

p/24 (Line 9)	Line 18
(A1+g) (Line 12)	Line 20
P/24 (Line 16)	Line 24
F1 (Line 14 or direct from ATT Tab VII)	Line 26
ML (Line 3)	Line 33 Col 4

15. Multiply p/24 by T in Line 19.
16. *Subtract* (see note 4) Line 19 from Line 20 to obtain θ in Line 21.
17. Enter Sin θ in M_2 and S_2 columns only of Line 22.
18. Enter Cos θ in all columns of Line 23.
19. Multiply P/24 by T in Line 25 and add to Line 26 to obtain interpolated value of F (=Ft) in Line 27.
20. Multiply H (Line 28) by Ft (Line 27). Enter result in Line 29.
21. Multiply Line 29 by Line 22 to obtain H.Ft.sin θ in M_2 and S_2 columns only.
22. Multiply Line 29 by Line 23 to obtain H.Ft.cos θ. Insert results for M_2, S_2 and O_1 in appropriate columns of Line 31. Insert result for K_1 in Line 30 (Col 4).

N.B.From here on the columns no longer refer to H.C.s and are referred to by their numbers.

23. Sum columns 1 and 2 of Line 30 and enter in Line 32, Col 1 (=R.sin r).
24. Sum columns 1 and 2 of Line 31 and enter in Line 32, Col 2 (=R.cos r), and Col 4.
25. From R.sin r and R.cos r obtain values of r (Line 33, Col 1) and R (Line 33 Col 2).
26. Obtain 2r in Line 34, Col 1 and 3r in Line 37, Col 1.
27. Obtain R^2 in Line 34 Col 2 and R^3 in Line 37 Col 2.
28. Add Lines 34 and 35 (Col 1) to obtain d_4 in Line 36.
29. Add Lines 37 and 38 (Col 1) to obtain d_6 in Line 39.
30. Multiply Lines 34 and 35 (Col 2) to obtain D_4 in Line 36.
31. Multiply Lines 37 and 38 (Col 2) to obtain D_6 in Line 39.
32. Obtain D_4.cos d_4 and insert in Line 36, Col 4.
33. Obtain D_6.cos d_6 and insert in Line 39, Col 4.
34. Finally sum Col 4, Lines 30, 31, 32, 33, 36 and 39; enter the result in Line 40.

Notes.

1. It is strongly recommended that calculations should bracket the required time and the results be plotted on any suitable squared paper. A single prediction is seldom of value as it gives no indication of the rate of rise or fall (in complicated ports it will not even be possible to ascertain whether it is rising or falling).

2. Although the box diagrams allow for entry of every step the capabilities of the calculator and the skill of the operator may enable many boxes to be left blank or placed in Memory. POLAR/RECTANGULAR conversion is particularly valuable and with this facility one can go from Line 17 to 31 without any intermediate writing down and with no ambiguity of quadrant.

3. In many cases interpolation between F1 and F2 can be carried out with sufficient accuracy by eye thus enabling Lines 13, 14, 15, 16, 24 and 25 to be omitted.

4. In order to simplify the calculation (or if being programmed to save steps and/or stores) the following approximations may be made. These are given in the order of their effect on the accuracy that with the least effect being given first:

(a) Omit lines 4 to 9. Insert the following rates in Line 18:

M_2	29.0 deg/hr
S_2	30.0 deg/hr
K_1	15.0 deg/hr
O_1	13.9 deg/hr

(b) As (a) but using the following rates:

M_2, S_2 } -29.32 deg/hr.

K_1, O_1 } -Half this figure i.e. 14.66 deg/hr.

(c) Omit interpolation of F. Hence omit Lines 13, 14, 15, 16, 24, 25 and 26 and insert Ft=F (direct from ATT Tab VII) in Line 27.

5. *Interpolation Between Tabulated Values of A and F.*

The hourly rates of change of A for each constituent can be calculated from consecutive tabulated values, care being taken to apply sufficient multiples of 360° to the tabulated values to ensure that these rates approximate to the astronomical values for each constituent - i.e. 30 deg/hr for M_2 and S_2 and 15 deg/hr for K_1 and O_1. This can be done as follows:

Daily Rate (p)=(A1+360.n) - A2

where n=o or the smallest integer which makes p>600 in the case of M_2 and S_2 and p>300 in the case of K_1 and O_1. Then for each of the four constituents:

At=A1 - (T×p)/24

(The values of A in Table VII are published in a form designed to simplify the arithmetic of the original graphical version of the Simplified Harmonic Method of Tidal Prediction (the tabulated value is 360° minus the astronomical value). The second term in the above expression is, therefore, SUBTRACTED.)

The interpolation for F for any given time is simpler:

Ft=F1 +(T×P)/24 where P=F2-F1

6. *Vectorial Addition of SD components*

The SD tide (R, r) at any time consists of the sum of the M_2 and S_2 tides. Thus:

R.sin r=H.Ft.sin(At+g) for M_2+H.Ft.sin(At+g) for S_2
R.cos r=H.Ft.cos(At+g) for M_2+H.Ft.cos(At+g) for S_2

and from this R and r may be obtained. If using a programmed calculator POLAR/RECTANGULAR conversion *must* be used to avoid ambiguity of sign or quadrant, but if the calculation is being done manually ordinary trig (and inverse trig) functions may be used provided great care is taken to resolve this ambiguity.

Shallow Water Corrections

The quarterdiurnal tide has phase ..... $d_4 = 2r + f_4$
and amplitude ..... $D_4 = R^2 \times F_4$
and the height correction due to the
quarterdiurnal effect ..... $h_4 = D_4 . \cos d_4$
The sixthdiurnal tide has phase ..... $d_6 = 3r + f_6$
and amplitude ..... $D_6 = R^3 \times F_6$
and hence height ..... $h_6 = D_6 . \cos d_6$

h4 and h6 must be summed algebraically to the combined SD and D tide to give a corrected height for the required time.

ADDITIONAL NOTES MORE APPLICABLE TO PROGRAMMABLE CALCULATORS

7. Although the boxes show a possible route through the problem this may not be the best route for every calculator.

8. If storage is limited, parameters can often be combined and placed each side of the decimal place after application of suitable multipliers e.g. g and H can be stored together: thus a g of 312 and H of 2.45 might be stored as 312.245. Strangely in some cases this not only reduces the number of stores required but also the program steps.

9. Given sufficient facilities on the calculator the following are recommended:
   (a) Automatic stepping of TIME at both fixed and variable intervals.
   (b) Ability to change Start Time of a series of predictions.
   (c) Prediction of successive days without re-entry of Harmonic Constants for each day.
   (d) Prediction for second port on same day without re-entry of astronomical data (A and F)
   (e) Recording of Harmonic Constants for any port. Steps should be allocated for amendment of carded data to allow for any changes.

Although possible to program for the derivation of a time of HW or of LW this has been found to be of little value. In a large number of ports where this method is of greatest use the curve may be so flat at these points that the actual time derived is meaningless: at ports where a double HW or LW or intermediate stand occurs there may well be ambiguity as to the point on the curve obtained. In most cases it is preferable to plot a short portion of the curve from the results of successive calculations.

10. It is sometimes more convenient to work in centimetres rather than metres provided there are no Shallow Water Corrections.

TIDE TABLES 2013

PART Ia

TIDAL STREAM PREDICTIONS

TIDAL STREAM TABLES

The tables give the following information:-

Maximum rates and the times at which these occur, together with the times of slack water i.e. when the direction of the stream turns.

The diagrams A, B and C opposite show the various types of stream which can occur ranging from predominantly semi-diurnal to predominantly diurnal through a mixture of both.

A. dominant semi-diurnal i.e. there are 2 maxima in each of the opposing directions and 4 times of turn (slack waters).

B. mixture of semi-diurnal and diurnal:-

(1) here there are still 2 maxima in each direction except that in one case the maximum is a zero rate.

(2) with increased diurnal effect 3 maxima occur without change of direction of the stream.

C. dominant diurnal:-

(1) one maximum in each direction and 2 times of turn (slack water).

(2) one stream may be so weak that its magnitude and direction are regarded as uncertain.

Unless otherwise stated at the foot of the page, the stream predictions do not include any steady current which may occur. This may be taken into account as shown in diagram D.

TYPICAL TIDAL STREAM CURVES Drawn from predicted times, maximum and zero rates

x ML inferred.
A Tides predicted in Argentine Tide Tables.
C Tides predicted in Chilean Tide Tables.
U Tides predicted in United States Tide Tables.

No.	
2018a	Tidal data for the ice shelf off the foot of Shackleton Glacier were obtained by gravimeter observations.
5546	There is a bore in the Bamu River at springs.
5607	At Wewak, MLHW = 1.2 metres and MHLW = 0.8 metres.
5635	At Anewa Bay, MLHW = 1.0 metres and MHLW = 0.9 metres.
5635a	At Kieta, MLHW = 0.9 metres and MHLW = 0.8 metres.
5636	At Choiseul Bay, MLHW = 0.9 metres and MHLW = 0.7 metres.
5639	At Sikopo Island, MLHW = 0.7 metres and MHLW = 0.6 metres.
5636-5710	Water levels may be much affected by the 'El Nino' event, see Pacific Islands Pilot, Vol. I (NP 60).
6000 6094, 6097	Seasonal changes of mean level are not known, but they are probably greater than those given for the coastal ports.
6183	In Port Augusta, wind effect is considerable. When the wind shifts from west to southward and blows strongly, mean level may be raised by 1.0 to 1.2 metres. With a strong north wind mean level may be lowered by 0.3 to 0.5 metres.
6210	At Mary Ann Haven, MLHW = 0.8 metres and MHLW = 0.6 metres.
6223	At Fremantle, the water level is erratic, being almost entirely governed by the weather. Before and after westerly gales, a high level of about 1.2 metres is maintained for possibly 6 days. In the summer months, especially during easterly weather, a very low level is experienced for the same period.
6278	Approximate predictions for Derby by variable time differences on Port Hedland: HWS +0310, HWN +0155; LWS +0420, LWN +0215.
6744	Water levels may be much affected by the 'El Nino' event, see Pacific Islands Pilot, Vol. II (NP 61).
6278 7213, 7258	Seasonal changes of mean level are not known, but they are probably greater than those given for the coastal ports.
6776, 6776a	The time zone kept on Kwajalein Atoll is +1200, see Admiralty List of Radio Signals, Vol. 2. (NP 282). Predictions obtained from these tables and from US Tide Tables therefore refer to the previous date on the atoll.
7277	A bore occurs in the Qiantang Jiang. It originates near Chi San (12 miles from Haining) at about Low Water (approximately HW at Luhuadao) and may attain a height of about 3 metres at springs and not more than 0.6 metres at neaps. For further information, see China Sea Pilot, Vol. III (NP 32).

No.

7294-7298 For further information on river levels in Changjiang, see China Sea Pilot, Vol. III (NP 32).

7440-7443 Seasonal changes of mean level are not known, but they are probably greater than those given for the coastal ports.

7458 A barrage now closes Taedong Kang at P'i Do and all ports up-river are non-tidal. Data for P'i Do are suspect.

7545 Wind influence is considerable at Komun Do. During southerly winds, rises are 0.6 to 1.0 metre higher than during northerly winds.

7647 A marked rise and fall of sea level occurs at Yobuko Ko, with period of about 12 minutes and range up to 0.3 metres.

7656 A marked rise and fall of sea level occurs at Sasebo, with periods of 64 and 83 minutes and range up to 0.2 metres.

7666 A marked rise and fall of sea level occurs at Nagasaki (the ''Abiki''), with periods of 32 and 36 minutes and range up to 0.6 metres; it is most pronounced during depressions when the isobars assume a very tortuous shape.

7754 A rise and fall of sea level occurs at Uchiumi, with period of 10 to 12 minutes and range up to 0.4 metres.

7757 A regular rise and fall of sea level occurs at Hososhima, with period of about 19 minutes and range up to 0.3 metres in calm weather and 0.6 metres during storms.

7931 A regular rise and fall of sea level occurs at Shimoda Ko (the ''Yota''), with period of about 16 minutes, and conspicuous during the approach of a depression when range may be over 0.2 metres.

7936 A regular rise and fall of sea level occurs at Aburatsubo, with period of about 15 minutes and range up to 0.3 metres during strong winds.

7940 During strong southerly winds, sea level at Yokohama may be raised 0.3 metres higher than normal.

7953 A regular rise and fall of sea level occurs at Chici Shima, with period of 16, 17 or 20 minutes and range 0.3 metres.

7997 A marked rise and fall of sea level occurs at Miyako, with period of about 22 minutes and range over 0.3 metres.

8014 A marked rise and fall of sea level occurs at Ominato, with period of about 40 minutes and range up to 0.3 metres.

8083 A marked rise and fall of sea level occurs at Hakodate, with period of 46 to 58 minutes and range up to 0.5 metres.

8136 A rather marked rise and fall of sea level occurs at Otaru, with period of about 15 minutes.

No.

8441-8510 As a rule, the only marked tide is the lower low water, the heights of the two high waters and the higher low water not differing greatly.

9005, 9123 Tidal predictions for these locations should be obtained from the Canadian Hydrographic Service (www.charts.gc.ca) or Admiralty Digital Publication (ADP) TotalTide.

9138-9141 Data in the Fraser River are applicable to non-freshet months. During the freshets, the arrival of the tide at places up the river is retarded by about 20 minutes at Port Coquitlam and by about 45 minutes at Port Haney. Also during freshets, at Sumas there is no tide and at New Westminster the mean tide level is raised by about 1.0 metre.

9228-9233 The Columbia River is subject to freshets, occurring annually in May to July, during which river level may be as much as 6.0 metres above normal at Portland; this effect decreases down-river to zero at Astoria. At Portland, mean river level varies from about 1.0 metre in October to 5.0 metres in June above the low water level datum.

9410 There is a bore in the Colorado River above Phillips Point; with spring tides, it is reported to be 1.0 to 2.0 metres in height.

9548-9580 On the coast of Peru, water levels may be much affected by the 'El Nino' event, see South America Pilot, Vol. III (NP 7).

9879a At Caleta Percy there are frequently double high waters.

9899 For data for E entrance to Magellan Strait see Admiralty Tide Tables Vol. 2, Europe (excluding United Kingdom and Ireland), Mediterranean Sea and Atlantic Ocean, No. 2099a.

The above table gives the correction to be applied to a position line or a fix for the effects of precession and nutation from the mean equinox of 2015·0. Each entry consists of the distance (in bold type) in nautical miles, and the direction (true bearing) in which the position line or fix is to be moved. The table is entered firstly by the year, then by choosing the column nearest the latitude and finally the entry nearest the LHA ♈ of observation; no interpolation is necessary, though in extreme cases near the beginning or end of a year (but not the end of 2014 or the beginning of 2015 when the corrections are zero) values midway towards those of the previous or following years may be taken.
