

1.2 How to use the Backup/Restore function

1. The backup restore function allows the user to save all data in the Viewer and restore the same in case of a breakdown. This can also be used to transfer updates from an online installation of Viewer to an offline installation.
2. To back up the current data on Viewer please go to the Settings panel.
3. Toggle the Backup button and browse to the location to want to save the back up to.
4. Click Backup to start the process.

5. Tick the “Export Overlays” if you want to backup routes, areas and other overlays you have created.
6. Restoring is nearly the exact same. You simply click the Restore toggle instead and browse to the Backup file.
7. If you want to import routes, areas and other overlays please tick the “Import Overlays” box.
